**2023 Q4 AMBIENT AIR QUALITY MONITORING REPORT
DURHAM YORK ENERGY CENTRE**

RWDI#2400035
February 9, 2024

1 INTRODUCTION

RWDI AIR Inc. (RWDI) was retained by Durham Region and York Region (the Regions) to conduct discrete and continuous air quality ambient monitoring at the Durham York Energy Centre (DYEC) monitoring stations. The facility address is 1835 Energy Drive, Clarington, Ontario. The DYEC is a facility that manages post diversion municipal solid waste from Durham Region and York Region to create energy from waste combustion.

Commercial operation of the DYEC commenced on February 1, 2016. The site location is shown below in Figure 1.

Condition 11 of the Environmental Assessment Notice of Approval and Condition 7(4) of the Environmental Compliance Approval (ECA) requires ambient air monitoring to be undertaken by the DYEC. An Ambient Air Monitoring and Reporting Plan was prepared and approved by the Ministry of Environment, Conservation and Parks (MECP) to satisfy these conditions. Two (2) monitoring stations were established to monitor ambient air quality around the DYEC and quantify the background ambient air quality levels and DYEC contributed emissions to ambient air quality levels.

This monitoring plan was developed based on the Regional Council mandate to provide ambient monitoring in the area of the DYEC. The purposes of the ambient monitoring program are to:

- Quantify any measurable ground level concentrations resulting from emissions from the DYEC cumulative to local air quality, including validating the predicted concentrations from the dispersion modelling conducted in the Environmental Assessment (2009a);
- Monitor concentration levels of EFW-related air contaminants in nearby residential areas; and,
- Quantify background ambient levels of air contaminants in the area.

The facility has two (2) monitoring stations which collect continuous and discrete ambient measurements, known as the Courtice station and Rundle Road station. The station locations are shown in Figure 1. The Courtice and Rundle Road stations were operational in May of 2013 and have been operated on behalf of the Region of Durham by Stantec Consulting Ltd. since that time up until July 31, 2018. RWDI has overseen the operation of the stations on behalf of the Region of Durham since August 1, 2018.

The Courtice and Rundle Road stations continuously monitor the following air quality parameters: Particulate Matter less than 2.5 microns ($PM_{2.5}$), Nitrogen Oxides (NO_x) and Sulfur Dioxide (SO_2). In addition, both discretely monitor the following air quality parameters: Total Suspended Particulate (TSP), Metals, Dioxins and Furans (D&F) and Polycyclic Aromatic Hydrocarbons (PAHs).

Continuous meteorological data is collected at the Courtice and Rundle Road stations. The Rundle Road station collects the following meteorological parameters: wind speed, wind direction, ambient temperature, precipitation and relative humidity. The Courtice station collects the following meteorological parameters: wind speed, wind direction, ambient temperature, ambient pressure, precipitation and relative humidity. The meteorological towers at both stations are approximately 10 meters tall.

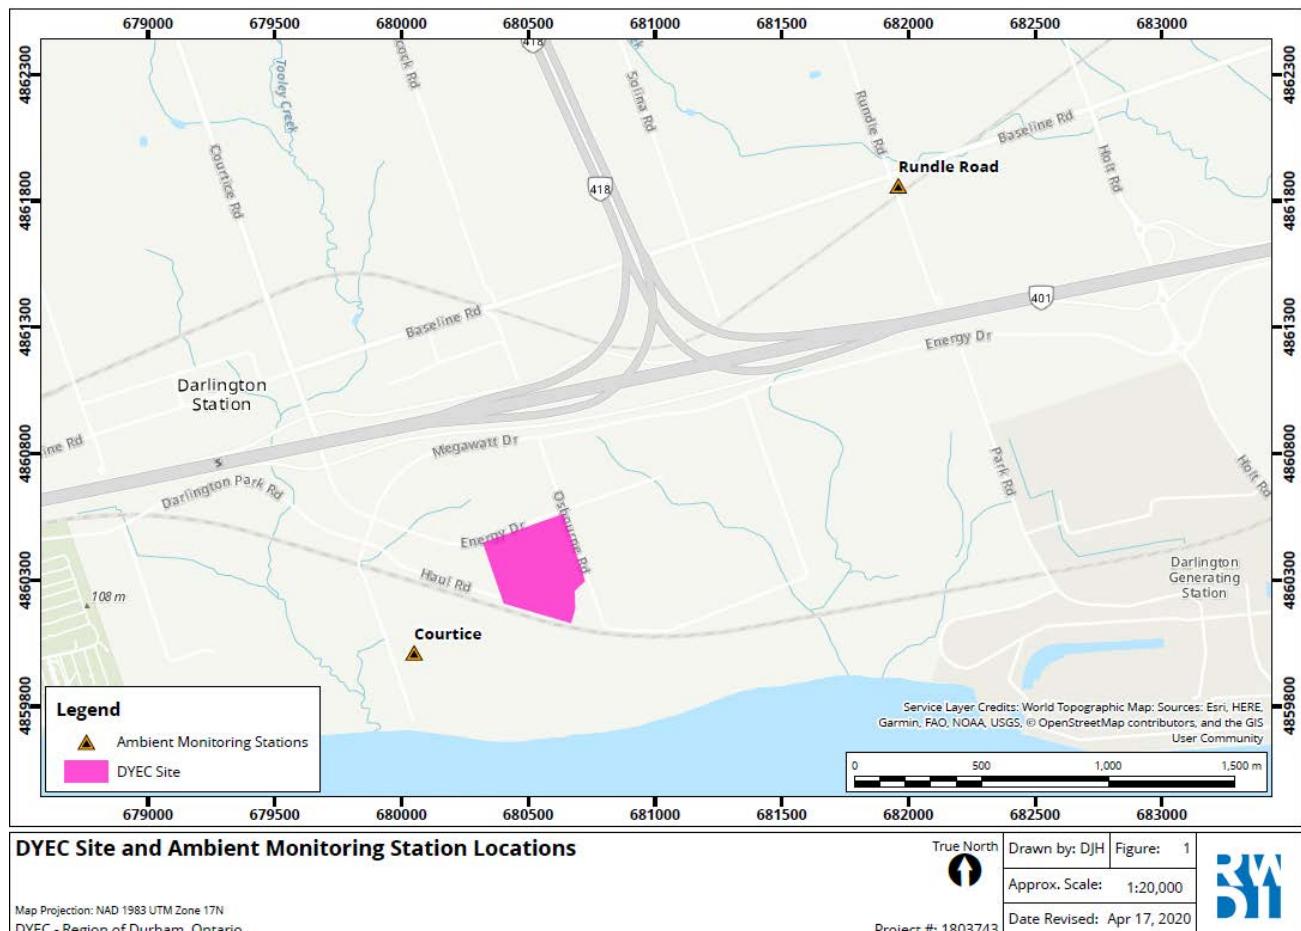

**2023 Q4 AMBIENT AIR QUALITY MONITORING REPORT
DURHAM YORK ENERGY CENTRE**

RWDI#2400035
February 9, 2024

Throughout this monitoring period there were one-hundred and eighty-nine (189) exceedance events of the rolling 10-minute SO₂ AAQC and seventy-eight (78) exceedance events of the rolling 1-hour SO₂ AAQC at the Courtice station. There were two (2) exceedance of the Benzo(a) Pyrene (B(a)P) AAQC at the Courtice station and three (3) exceedance of the B(a)P AAQC at the Rundle Road station. The exceedances occurred at the Courtice station on October 3rd and December 14th, 2023, and the exceedances at the Rundle Road station occurred on October 3rd, November 20th, and December 14th, 2023. Data recovery rates were acceptable and valid for all measured Q4 continuous and discrete parameters.

Figure 1: DYEC Site and Ambient Monitoring Station Locations

1.1 Sampling Locations

The station sites were selected in consultation with a working group that included representatives from the MECP, the Region of Durham, York Region, and the Energy from Waste Advisory Committee (EFWAC), as required by Condition 11.3 of the Environmental Assessment Notice of Approval. The Courtice station is predominantly upwind of the DYEC and is located on the Courtice WPCP property just southwest of the DYEC. The Rundle Road station is predominantly downwind of the DYEC and is located just southeast of the intersection of Baseline Road and Rundle Road just northeast of the DYEC. Pictures of the two (2) stations are presented as **Figure 2** and **Figure 3**.

Figure 2: Rundle Road Station

Figure 3: Courtice Station

2 SAMPLING METHODOLOGY

The Rundle Road and Courtice stations are both equipped with the following continuous monitors: Thermo Scientific Model 5030 SHARP (Synchronized Hybrid Ambient Real-time Particulate) monitor (PM_{2.5} analyzer), Teledyne Nitrogen Oxides Analyzer Model T200 (NO_x analyzer), and a Teledyne Sulfur Dioxide Analyzer Model T100 (SO₂ analyzer). Both stations also have the following periodic monitors: High Volume (Hi-Vol) Air Sampler outfitted with a TSP inlet head as approved by the United States Environmental Protection Agency (U.S. EPA), and a Hi-Vol Air Sampler outfitted with a polyurethane foam plug and circular quartz filter for measuring PAH's and D&F's as approved by U.S. EPA.

2.1 Nitrogen Oxide Analyzers

The Teledyne T200 Nitrogen Oxide (NO_x) analyzers use chemiluminescence detection, coupled with microprocessor technology to provide sensitivity and stability for ambient air quality applications. The instrument determines real-time concentration of nitric oxide (NO), total nitrogen oxides (NO_x) (the sum of NO and NO₂), and nitrogen dioxide (NO₂). The amount of NO is measured by detecting the chemiluminescence reaction that occurs in the reaction cell when NO molecules are exposed to ozone (O₃). The NO and O₃ molecules collide in the reaction cell and enter a higher energy state.

When these excited molecules return to a stable energy state, they emit a photon of light which is proportional to the amount of NO in the sample stream of gas entering the analyzer.

To determine the total NO_x (NO+NO₂) measurement, sample gas is periodically bypassed through a heated molybdenum converter cartridge that converts any NO₂ molecules in the sample stream into NO (any existing NO molecules in the stream remain as is). The instrument will switch the sample stream through the converter periodically and then through the reaction cell where the same chemiluminescence reaction occurs with ozone.

The resultant response produced is now the sum of NO and converted NO₂ producing a NO_x measurement. The resultant NO₂ determination is the NO_x measurement subtracted from the NO measurement.

The NO_x analyzers were zero and span checked daily using the internal zero and span (IZS) system and calibrated once a month using either EPA protocol span gases and a dilution system or an ESA permeation tube calibrator. Automatic IZS checks were performed on a daily basis commencing at approximately 01:45 and ending at 02:15. The checks consisted of a 10-minute zero check, a 10-minute span check and a 10-minute purge. These checks provide a way to monitor daily performance of the analyzer using an external charcoal and purafil zeroing cartridge for the zero, and an internal permeation oven with a permeation tube for the span. These IZS checks are not for calibration purposes but are merely a diagnostic tool to identify instrument drift.

The instrument collects data using its own data acquisition system (DAS) on a 5-minute interval. Data is collected from the instrument directly to an EnviDAS logger at 1-min, 5-min and 60-min intervals. The logger can be accessed remotely, and all instrument parameters can be examined as well as the measurement data. This allows the tracking of instrument performance. Data was also collected at 1-minute intervals by an external datalogger using analog output connections as a back-up. The measurement data was averaged using Envista processing software over a 1-hour and 24-hour period to compare to the applicable ambient air quality criteria.

2.2 Sulphur Dioxide Analyzers

The Teledyne T100 Sulphur Dioxide (SO₂) Analyzer is a microprocessor-controlled analyzer that determines the concentration of SO₂ in a sample gas drawn through the instrument. In the sample chamber, sample gas is excited by ultraviolet light causing the SO₂ to absorb energy from the light and move to an active state (SO₂*). These active SO₂* molecules must decay into a stable state back to SO₂, and when this happens a photon of light is released which is recognized by the instrument as fluorescence. The instrument measures the amount of fluorescence to determine the amount of SO₂ present in the sample gas.

The SO₂ analyzers were zero and span checked daily using the IZS system and calibrated once a month using either EPA protocol span gases and a dilution system or an ESA permeation tube calibrator. Automatic IZS checks were performed on a daily basis commencing at approximately 01:45 and ending at 02:15. The checks consisted of a 10-minute zero check, a 10-minute span check and a 10-minute purge. These checks provide a way to monitor daily performance of the analyzer using an external charcoal and purafil zeroing cartridge for the zero, and an internal permeation oven with a permeation tube for the span. These IZS checks are not for calibration purposes but are merely a diagnostic tool to identify instrument drift.

The instrument collects data using its own data acquisition system (DAS) on a 5-minute interval. Data is collected from the instrument directly to an EnviDAS logger at 1-min, 5-min and 60-min intervals. The logger can be accessed remotely, and all instrument parameters can be examined as well as the measurement data. This allows the tracking of instrument performance. Data was also collected at 1-minute intervals by an external datalogger using analog output connections as a back-up. The measurement data was averaged using Envista processing software over a 1-hour and 24-hour period to compare to the applicable ambient air quality criteria.

2.3 SHARP 5030 PM_{2.5} Analyzers

The SHARP 5030 is a hybrid nephelometric/radiometric particulate mass monitor capable of providing precise, real-time measurements with a superior detection limit. The SHARP incorporates a high sensitivity light scattering photometer whose output signal is continuously referenced to the time-averaged measurement of an integral beta attenuating mass sensor. The SHARP also incorporates a dynamic inlet heating system designed to maintain the relative humidity of the air passing through the filter tape constant.

The SHARP is calibrated once a month to ensure accuracy and validity of its data. The PM_{2.5} inlet head and sharp cut cyclone is cleaned monthly as well to ensure proper performance. The monthly calibration process consists of the following: zeroing the nephelometer if necessary, calibration of ambient temperature, calibration of barometric pressure, and calibration of the flow.

The instrument collects data using its own data acquisition system (DAS) on a 5-minute interval. Data is collected from the instrument directly to an EnviDAS logger at 1-min, 5-min and 60-min intervals. The logger can be accessed remotely, and all instrument parameters can be examined as well as the measurement data. This allows the tracking of instrument performance. Data was also collected at 1-minute intervals by an external datalogger using analog output connections as a back-up. The measurement data was averaged using Envista processing software over a 1-hour and 24-hour period to compare to the applicable ambient air quality criteria.

2.4 TSP High Volume Air Samplers

The Tisch TE-5170 Total Suspended Particulate (TSP) high volume (Hi-Vol) air samplers were outfitted with a TSP gabled inlet capable of collecting particulate of all aerodynamic diameters. Each Hi-Vol is equipped with a mass flow controller, which ensures a flow rate of 40 cubic feet per minute (CFM), a chart recorder for measuring cfm flow throughout the run time, an elapsed timer and a wheel timer for starting and stopping each sample. In the latter part of 2019, the pin-based wheel timer was modified with an automated relay system controlled by a data logger to toggle the sampler on and off, and the chart recorder system was replaced by a digital pressure transducer to record the blower output pressure. Teflon coated glass fibre filters are outfitted at the top of the hi-vol samplers where air is drawn through the filter, thereby collecting TSP. Each Hi-Vol is calibrated quarterly (every three months) to ensure accuracy and validity of the volume of air drawn through the sampler.

The Teflon coated glass fibre filter media was pre and post weighed by ALS Laboratories in Burlington, Ontario. The filters are then analyzed for total particulate weight, metals analysis and mercury.

2.5 Polyurethane Foam Samplers

The D&F, and PAH samples were collected using Tisch TE-1000 samplers, which are listed as reference devices for U.S. EPA Methods TO-9 and TO-13. The samplers use a collection filter that is 'backed-up' by a polyurethane foam (PUF) plug. The airborne compounds present in the particulate phase are collected on the Teflon coated glass fibre filter and any compounds present in the vapour phase are absorbed in the PUF plug. Each PUF sampler is equipped with a mass flow controller, which can sustain 8 CFM of flow over the sampling period, an elapsed timer and a wheel timer for starting and stopping each sample.

In the latter part of 2019, the pin-based wheel timer was modified with an automated relay system controlled by a data logger to toggle the sampler on and off, and the chart recorder system was replaced by a digital pressure transducer to record the blower output pressure. Each PUF sampler is calibrated quarterly (every three months) to ensure accuracy and validity of the volume of air drawn through the sampler.

The filter and PUF media/glassware is proofed and analyzed by ALS Laboratories in Burlington, Ontario. The filters and PUF/XAD plugs are then analyzed for PAH's and D&F's.

2.6 Meteorological Towers

Meteorological data was collected from the Rundle Road and Courtice stations. This is done so that a vector could be associated with the applicable contaminant concentrations. The Rundle Road and Courtice stations are outfitted with a Campbell Scientific HMP60 Temperature / Relative Humidity probe, and a Texas Instruments TE525M rain gauge. Meteorological data was collected at 1-minute intervals and was averaged using Envista processing software over a 1-hour period.

**2023 Q4 AMBIENT AIR QUALITY MONITORING REPORT
DURHAM YORK ENERGY CENTRE**

RWDI#2400035
February 9, 2024

3 AIR QUALITY CRITERIA AND STANDARDS

The monitored contaminant concentrations were compared to air quality criteria and standards set by the MECP and by Environment Canada. The MECP developed Ambient Air Quality Criteria (AAQCs) which are the maximum desirable concentrations in the outdoor air, based on effects to the environment and health (MECP, 2012). Not all contaminants have an applicable regulatory limit; therefore, other criteria were used for comparison. These included human health risk assessment (HHRA) criteria.

Environment Canada has established a Canadian Ambient Air Quality Standard (CAAQS) which are health-based air quality objectives for the outdoor air (Environment Canada, 2013). The current CAAQS' for PM_{2.5} are 27 µg/m³ for the 3-year average of annual 98th percentile 24-hour concentration, and 8.8 µg/m³ for the 3-year average of annual average concentrations (in effect as of 2020). The CAAQS' are listed in **Table 1**. No direct comparison to the 2020 CAAQS' is appropriate for this report, as the standards are only applicable to 3-year averaged data which is provided in the annual reports.

Table 1: PM_{2.5}, SO₂ and NO₂ CAAQS' by Implementation Year

Parameter	Averaging Time	Year Applied		Statistical Form
		2020	2025	
Fine Particulate Matter (PM_{2.5})	24-hour	27	The 3-year average of the annual 98 th percentile of the daily 24-hour average concentrations	
		µg/m ³		
Sulphur Dioxide (SO₂)	Annual	8.8	The 3-year average of the annual average of all 1-hour concentrations	
		µg/m ³		
Nitrogen Dioxide (NO₂)	1-hour	70	65	The 3-year average of the annual 99 th percentile of the SO ₂ daily maximum 1-hour average concentrations
		ppb	ppb	
	Annual	5	4	The average over a single calendar year of all 1-hour average SO ₂ concentrations
		ppb	ppb	
	1-hour	60	42	The 3-year average of the annual 98 th percentile of the daily maximum 1-hour average concentrations
		Ppb	ppb	
	Annual	17	12	The average over a single calendar year of all 1-hour average concentrations
		Ppb	Ppb	

(CCME,2019)

All applicable criteria and standards are shown in the 'Summary of Ambient Measurements' section of this report.

4 MECP AUDITS

There was an MECP audit conducted on December 7, 2023. All instruments met their respective audit criteria.

5 SUMMARY OF AMBIENT MEASUREMENTS

Ambient air quality monitoring results for all contaminants sampled at the Courtice and Rundle Road stations are discussed herein. Summary statistics from October to December 2023 are presented in a summary format below and in a more detailed matrix format in **Appendix A** for continuous measurements and **Appendix B** for discrete measurements.

5.1 Meteorological Station Results

5.1.1 Courtice Station Results

The Courtice station collected the following meteorological parameters: wind speed, wind direction, relative humidity, ambient temperature, ambient pressure and precipitation. The meteorological tower at the station is at a height of approximately 10 meters tall. The Courtice station maintained a minimum average of 88% of data collection for all of the parameters measured during Q4. Hourly statistics from the meteorological station are presented in **Table 2**. A wind rose showing trends in wind speed and wind direction during Q4 is provided in **Figure 4**. The Courtice rain instrument malfunctioned, and no rain data was recorded from the beginning of the quarter until repairs were completed at 20:00 on October 11, 2023.

Figure 4: Wind Roses of Hourly Wind Speed and Wind Direction – October to December 2023

Notes:

¹ – Rain total, monthly and quarterly means not presented due to not meeting data validity criteria of >75%

5.1.2 Rundle Road Station Results

The Rundle Road station collected the following meteorological parameters: wind speed, wind direction, relative humidity, ambient temperature and precipitation. The meteorological tower at the station is at a height of approximately 10 meters tall. The Rundle Road station maintained a minimum average of 97% data collection for all of the meteorological parameters measured during Q4. Hourly statistics from the meteorological station is presented in **Table 3**. A wind rose showing trends in wind speed and wind direction during Q4 is provided in **Figure 4**.

5.2 NO_x, SO₂ and PM_{2.5} Summary Table Results

Table 4 provides a summary of Maximum 1-hour Rolling Means, Maximum 24-hour Rolling Means, Monthly Means, Quarterly Means and Percent valid data for the Courtice station. **Table 5** provides a summary of Maximum 1-hour Means, Maximum 24-hour Means, Monthly Means, Quarterly Means and Percent valid data for the Rundle Road station. **Table 6** provides a summary of exceedance statistics for both Courtice and Rundle Road stations. At the Courtice station, there were one-hundred and eighty-nine (189) exceedance events of the rolling 10-minute SO₂ AAQC and seventy-eight (78) exceedance events of the 1-hour SO₂ AAQC in Q4. At the Rundle Road station, there were no exceedances events of the rolling 10-minute SO₂ AAQC or the 1-hour SO₂ AAQC in Q4.

5.3 Oxides of Nitrogen Results

5.3.1 Courtice Station Results

Data recovery levels were high for oxides of nitrogen (99.2% valid data). Monitoring results were compared to the AAQC for NO₂ only, as it is the only parameter that has AAQC values for 1-hour and 24-hour averaging periods (there are no AAQC's for NO or NO_x). There were no exceedances above the AAQC values for the entirety of the sampling period for rolling 1-hour and 24-hour averaged data. The highest NO₂ value seen among the 1-hour rolling averages was 41.4 ppb, which is 20.7% of the AAQC. The highest NO₂ value seen among the rolling 24-hour averages was 18.9 ppb, which is 18.9% of the AAQC. The measurements are summarized in **Table 4** above. A pollution rose is presented in **Figure 5** for the Courtice station during Q4 composed of hourly average NO₂ concentrations. A pollution rose indicates the percentage of time that the wind originates from a given direction coupled with the pollutant measurement for that time in either ppb or micrograms per meter cubed. In order to show where possible major sources of pollutants are coming from, levels below 5 ppb were omitted from the graphic wind rose representation.

The Courtice station pollution rose in **Figure 5** shows the majority of the NO₂ impacts were largely from the northeast to east and west-southwest to northwest. The station is downwind of the DYEC when winds are from the northeast and east-northeast directions, which occurred during the monitoring period, therefore it is likely that the DYEC contributed to the observed concentrations from those directions. There are additional impacts from the north-northeast, southwest, and north-northwest, which indicates reception from surrounding industry or the highway and railway corridors.

5.3.2 Rundle Road Station Results

Data recovery levels were high for oxides of nitrogen (99.6% valid data). There were no exceedances above the AAQC values for the entirety of the sampling period for rolling 1-hour and 24-hour averaged data. The highest NO₂ value seen among the 1-hour rolling averages was 31.5 ppb, which is 15.8% of the AAQC. The highest NO₂ value seen among the rolling 24-hour averages was 16.5 ppb, which is 16.5% of the AAQC. The measurements are summarized in **Table 5** above.

A pollution rose is presented in **Figure 5** for the Rundle Road station during Q4 composed of hourly average NO₂ concentrations. In order to show where possible major sources of pollutants are coming from, levels below 5 ppb were omitted from the graphic wind rose representation.

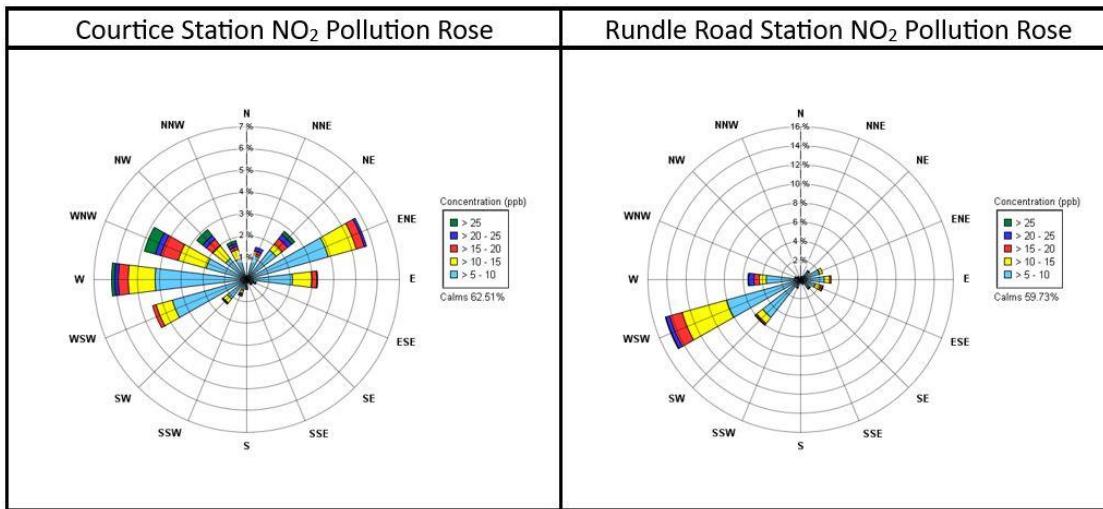

The Rundle Road station pollution rose in **Figure 5** shows that the majority of elevated NO₂ events at the Rundle Road station occurred when winds were from the southwest to west. The station is downwind of the DYEC when winds are from the south-southwest and southwest directions. Elevated concentrations occurred occasionally from the southwest during the monitoring period, therefore it is likely that the DYEC partially contributed to the observed concentrations. There are additional impacts from the west-southwest to west and the east-northeast to east-southeast which indicates reception from surrounding industry or the highway and railway corridors.

February 9, 2024

Figure 5: Pollution Roses of Hourly Average NO₂ Concentrations – October to December 2023

5.4 Sulphur Dioxide Results

5.4.1 Courtice Station Results

Data recovery levels were high for sulphur dioxide (99.3% valid data). Monitoring results were compared to the AAQC for 10-minute and 1-hour rolling average periods. In 2023, there have been more frequent SO₂ concentrations elevated above the AAQC's than in previous years due to the new limits imposed at the start of 2020. The highest SO₂ value seen among the 10-min rolling averages was 467.5 ppb, which is 697.8% of the AAQC. The highest SO₂ value seen among the 1-hour rolling averages was 134.4 ppb, which is 336.0% of the AAQC. There were one-hundred and eighty-nine (189) exceedance events above the rolling 10-minute AAQC and seventy-eight (78) exceedance events above the rolling 1-hour AAQC. A table outlining the interpretation of the exceedance period can be found in [Appendix E](#).

The SO₂ statistical results are summarized in [Table 4](#) above. A pollution rose is presented in [Figure 6](#) for the Courtice station during Q4 composed of hourly average SO₂ concentrations. In order to show where possible major sources of pollutants are coming from, levels below 5 ppb were omitted from the graphic wind rose representation. A pollution rose is presented in [Figure 7](#) for the Courtice station during Q4 composed of 5-minute average SO₂ concentrations with levels below 67 ppb omitted to illustrate directionality of exceedance concentrations.

The Courtice station pollution rose in [Figure 6](#) shows that the majority of elevated SO₂ events at Courtice occurred from the north-northeast to northeast directions. The events were likely a result of emissions from surrounding industrial sources with contributions from the DYEC in the northeast direction.

The Courtice station pollution rose in [Figure 7](#) shows that <1.25% of the 5-min SO₂ events are elevated >67 ppb and the majority occurred from the north-northwest to north-northeast directions. The pollution rose indicates that the DYEC maybe a potential contributor to SO₂ levels at the station along with other industrial activity nearby.

2023 Q4 AMBIENT AIR QUALITY MONITORING REPORT DURHAM YORK ENERGY CENTRE

RWDI#2400035
February 9, 2024

A Technical Memorandum summarizing the DYEC SO₂ continuous emissions monitoring system (CEMS) data during the exceedance events recorded at the Courtice and Rundle Road Ambient Monitoring stations for Q4, is included in **Appendix G**. The Memorandum indicates that based on the in-stack concentration levels measured by the CEMS, that there were no unusual levels of SO₂ emissions during the ambient station exceedance events and that the facility's impact on ambient air quality would be expected to be quite low.

5.4.2 Rundle Road Station Results

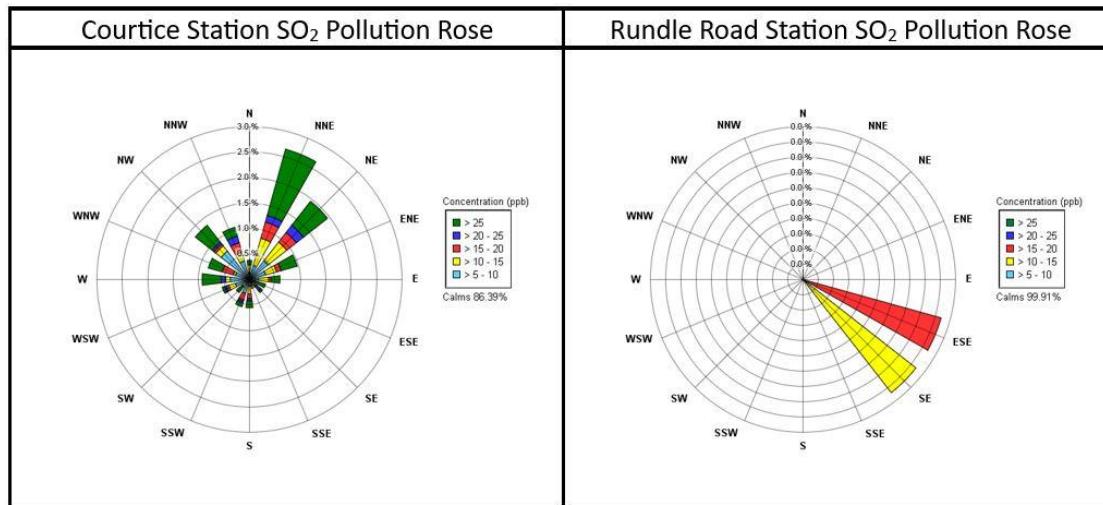

Data recovery levels were high for sulphur dioxide (99.6% valid data). Monitoring results were compared to the AAQC for 10-minute and 1-hour rolling average periods. The highest SO₂ value seen among the 10-min rolling averages was 47.2 ppb, which is 70.4% of the AAQC. The highest SO₂ value seen among the 1-hour rolling averages was 26.8 ppb, which is 67.0% of the AAQC.

The SO₂ statistical results are summarized in **Table 5** above. A pollution rose is presented in **Figure 6** for the Rundle Road station during Q4 composed of hourly average SO₂ concentrations. In order to show where possible major sources of pollutants are coming from, levels below 5 ppb were omitted from the graphic wind rose representation. A pollution rose is presented in **Figure 7** for the Rundle Road station during Q4 composed of 5-minute average SO₂ concentrations with levels below 67 ppb omitted to illustrate directionality of exceedance concentrations.

The Rundle Road station pollution rose in **Figure 6** shows the majority of elevated SO₂ events at Rundle Road occurred from the east-southeast and southeast directions. The events were likely a result of emissions from surrounding sources.

The Rundle Road station pollution rose in **Figure 7** shows that there were no 5-min SO₂ events that are elevated >67 ppb.

Figure 7: Pollution Roses of 5-minute Average SO₂ Concentrations >67 ppb – October to December 2023

5.5 Fine Particulate Matter (PM_{2.5}) Results

5.5.1 Courtice Station Results

Data recovery levels were high for particulate matter less than 2.5 microns (99.5% valid data). There is no 1-hour AAQC or standard for PM_{2.5}, but there is a 24-hour CAAQS of 27 µg/m³ for the 3-year average of the annual 98th percentile 24-hour concentrations, and 8.8 µg/m³ for the 3-year average of the annual average concentrations (in effect as of 2020). Note that since the reported data is only quarterly and the CAAQS is applicable to the 3-year average, the CAAQS' for PM_{2.5} was not applicable to the data. The highest PM_{2.5} value seen among the 1-hour rolling averages was 33.6 µg/m³ and the highest value seen among the 24-hour rolling averages was 20.0 µg/m³. The results are summarized in **Table 4** above.

A pollution rose is presented in **Figure 8** for the Courtice station during Q4 composed of hourly average PM_{2.5} concentrations. In order to show where possible major sources of pollutants are coming from, levels below 5 µg/m³ were omitted from the graphic wind rose representation.

The Courtice station pollution rose in **Figure 8** shows that the majority of elevated PM_{2.5} events at Courtice occurred when winds were from the west-southwest and east-northeast, which places the station downwind of the DYEC occasionally. Other contributions are in line with nearby industrial activity.

5.5.2 Rundle Road Station Results

Data recovery levels were high for particulate matter less than 2.5 microns (99.8% valid data). The highest PM_{2.5} value seen among the 1-hour rolling averages was 67.2 µg/m³ and the highest value seen among the 24-hour rolling averages was 21.5 µg/m³. The results are summarized in **Table 5** above. A pollution rose is presented in **Figure 8** for the Rundle Road station during Q4 composed of hourly average PM_{2.5} concentrations. In order to show where possible major sources of pollutants are coming from, levels below 5 µg/m³ were omitted from the graphic wind rose representation.

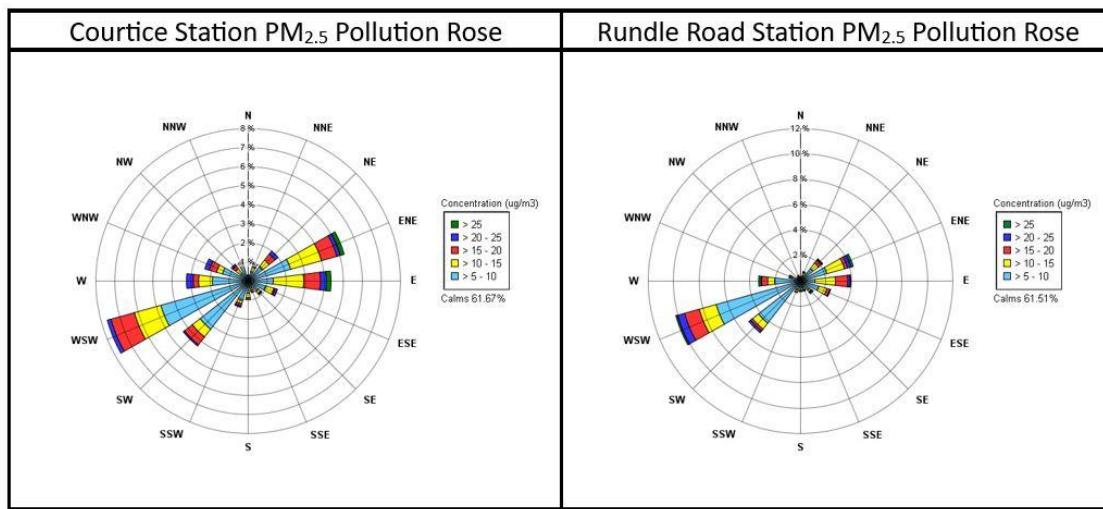

**2023 Q4 AMBIENT AIR QUALITY MONITORING REPORT
DURHAM YORK ENERGY CENTRE**

RWDI#2400035
February 9, 2024

The Rundle Road pollution rose in **Figure 8** shows that the majority of elevated PM_{2.5} events at the Rundle Road station occurred when winds were from the southwest to west-southwest. Elevated concentrations were frequent from the southwest during the monitoring period, therefore it is likely that the DYEC partially contributed to the observed concentrations. Other possible contributions include surrounding industry, nearby high traffic areas and urban background.

Figure 8: Pollution Roses of Hourly Average PM_{2.5} Concentrations – October to December 2023

5.6 TSP and Metals Hi-Vol Results

All of the TSP Hi-Vols operated on a discrete schedule every 6 days according to the NAPS schedule during Q4 with the sample days being: October 3, 9, 15, 21, 27, November 2, 8, 14, 20, 26, December 2, 8, 14, 20 and 26, 2023.

5.6.1 Courtice Station Results

Data recovery levels were high for the TSP sampler at the Courtice station (93% valid data). There were no exceedances of any of the AAQC's or HHRA Criteria for TSP, mercury or metals during Q4. **Table 7** is a summary of the statistics for this station.

Table 7: Summary of TSP Sampler Courtice Station

5.6.1 Rundle Road Station Results

Data recovery levels were high for the TSP sampler at the Rundle Road station (93% valid data). There were no exceedances of any of the AAQC's or HHRA Criteria for TSP, mercury or metals during Q4. **Table 8** is a summary of the station statistics.

Table 8: Summary of TSP Sampler Rundle Road Station

Contaminant	Units	MECP Criteria	HHRA Health Based Criteria	No. > Criteria	Geometric Mean	Arithmetic Mean	Q4 Minimum Concentration	Q4 Maximum Concentration	October Maximum Concentration	November Maximum Concentration	December Maximum Concentration	Number of Valid Samples	% Valid data

5.7 PAH Results

All of the PUF Hi-Vols operated on a discrete schedule every 12 days for PAH's according to the NAPS schedule during Q4 with the sample days being: October 3, 15, 27, November 8, 20, December 2, 14 and 26, 2023.

5.7.1 Courtice Station Results

Data recovery levels were high for the PAH results at the Courtice station (100% valid data). There were two (2) exceedances of the B(a)P AAQC during Q4 of 2023. There were no other exceedances of any of the AAQC's or HHRA Criteria.

The BaP exceedances occurred on October 3 and December 14, 2023. Since the winds were predominantly coming from the west-southwest, southwest and northeast, the Courtice station was primarily upwind of the DYEC during the sampling period. It is unlikely that the measured BaP exceedance is attributable to the Energy Centre operations.

The exceedance documentation is attached in **Appendix F**. **Table 9** outlines the statistics summary for this station.

Table 9: Statistics Summary of PAH Results for Courtice Station

5.7.2 Rundle Road Station Results

Data recovery levels were high for the PAH results at the Rundle Road station (88% valid data). The single invalid sample on November 8 was due to equipment malfunction. There were three (3) exceedances of the B(a)P AAQC during Q4 of 2023. There were no other exceedances of any of the AAQC's or HHRA Criteria.

The BaP exceedances occurred on October 3, November 20 and December 14, 2023. Since the winds were predominantly coming from the southwest (October 3), north-northwest to east (November 20) and west-southwest (December 14), the Rundle Road station was primarily downwind on October 3, primarily upwind on November 20 and neither upwind nor downwind on December 14 of the DYEC during the sampling periods. On October 3, it is possible that the measured BaP exceedance is attributable to the Energy Centre operations, however it is likely that there were significant contributions from offsite sources as measured at Courtice, which was upwind. On November 20 and December 14, the Rundle Road station was not downwind of the DYEC and so it is unlikely that the Energy Centre operations contributed to the measured exceedances.

The exceedance documentation is attached in **Appendix F**. **Table 10** outlines the statistics summary for this station.

5.8 Dioxin and Furan Results

All of the PUF Hi-Vols operated on a discrete schedule every 24 days for D&F's according to the NAPS schedule during Q4 with the sample days being: October 15, November 8, December 2 and 26, 2023.

5.8.1 Courtice Station Results

Data recovery levels were high for the D&F results at the Courtice station (100% valid data). There were no exceedances of any of the AAQC's or HHRA Criteria for any of the D&F's during Q4. **Table 11** is a summary of the statistics for this station.

Table 11: Courtice Station Q4 Monitoring Results for Dioxins and Furans

5.8.2 Rundle Road Station Results

Data recovery levels were acceptable for the D&F results at the Rundle Road station (75% valid data). There were no exceedances of any of the AAQC's or HHRA Criteria for any of the D&F's during Q4. **Table 12** is a summary of the statistics for this station.

6 DATA REQUESTS

The following sections outline any instrumentation issues encountered that have caused data loss at any of the monitors at each of the stations.

Appendix C contains monthly IZS zero trends for the NO_x and SO₂ analyzers at the Courtice and Rundle Road stations.

Edit logs identifying missing data, maintenance times, calibrations and any other missing data have been included in **Appendix D**.

6.1 Continuous Monitoring

On October 1, 2023, the Courtice rain instrument was out of service beginning at 0:00 and lasted until October 11, 2023, at 20:00.

On October 25, 2023, the Courtice station experience a power outage that lasted 1 hour which caused data loss from 12:00 to 13:00.

On November 21, 2023, the Courtice station experience a power outage that lasted 3 hours which caused data loss from 11:00 to 14:00.

On November 22, 2023, the Courtice station experience a power outage that lasted 1 hour which caused data loss at 11:00.

6.2 Discrete Monitoring

The October 3, 2023, Courtice TSP samples were invalidated due to equipment malfunction.

The October 27, 2023, Rundle Road TSP samples were invalidated due to equipment malfunction.

The November 8, 2023, Rundle Road PAH sample was invalid due to an equipment malfunction.

7 CONCLUSIONS

This Q4 report provides a summary of the ambient air quality data collected at the Courtice and Rundle Road stations. There were one-hundred and eighty-nine (189) exceedance events above the rolling 10-minute SO₂ AAQC and seventy-eight (78) exceedance events above the 1-hour SO₂ AAQC at the Courtice station. There were two (2) exceedances of the B(a)P AAQC at the Courtice station on October 3 and December 14, 2023. There were three (3) exceedances of the B(a)P AAQC at the Rundle Road station on October 3, November 20 and December 14, 2023. Data recovery rates were acceptable and valid for all measured Q4 continuous and discrete parameters.

9 GENERAL STATEMENT OF LIMITATIONS

This report entitled "2023 Q4 Ambient Air Quality Monitoring Report", dated February 9, 2024, was prepared by RWDI AIR Inc. ("RWDI") for The Regional Municipality of Durham ("Client"). The findings and conclusions presented in this report have been prepared for the Client and are specific to the project described herein ("Project"). This report was prepared using scientific principles, published methodologies and professional judgment in assessing available information and data. The findings presented within this document are based on available data within the limits of the existing information, budgeted scope of work, and schedule. The conclusions contained in this report are based on the information available to RWDI when this report was prepared; subsequent changes made by the Client after the date of this report have not been reflected in the conclusions.

This report was prepared for the exclusive use of The Regional Municipality of Durham and the MECP. Any use which a third party makes of this report, or any reliance on or decisions made based on it, are the responsibility of such third parties. RWDI accepts no responsibility for damages, if any, suffered by any third party as result of decisions made or actions based on this report.

An abstract graphic design element consisting of a large blue triangle pointing towards the top left and a white curved line that starts from the bottom left and arches upwards and to the right, partially enclosing the blue triangle.

Notes:

D, T & V	- Date, Time & Exceedence Value Reported
Faded Values	- Not used to calculate the number of reportable exceedences
	- Range of 5-minute measurements that contribute to the Exceedance Value Report
<u>Max</u>	- Maximum of the Range
<u>Min</u>	- Minimum of the Range

Ambient Air Quality Criteria (AAQC) for SO2 = 67 ppb for 10-minute running average

Total Number of Reportable Exceedances:

32

Notes:

D, T & V	- Date, Time & Exceedence Value Reported
Faded Values	- Not used to calculate the number of reportable exceedences
	- Range of 5-minute measurements that contribute to the Exceedance Value Reported
<u>Max</u>	- Maximum of the Range
<u>Min</u>	- Minimum of the Range

Ambient Air Quality Criteria (AAQC) for SO₂ = 40 ppb for 1-hour running average

Total Number of Reportable Exceedances:

11

SO2 Exceedance Report

Notes:

D, T & V	- Date, Time & Exceedence Value Reported
Faded Values	- Not used to calculate the number of reportable exceedences
	- Range of 5-minute measurements that contribute to the Exceedance Value Reported
Max	- Maximum of the Range
Min	- Minimum of the Range

Ambient Air Quality Criteria (AAQC) for SO2 = 40 ppb for 1-hour running average

Total Number of Reportable Exceedances:

SO2 Exceedance Report

RE:	Exceedance Report – Benzo(a)Pyrene October 3, 2023 Region of Durham, DYEC	

On November 6, 2023, the results from ALS Environmental were received regarding the PAH results from the October 3, 2023, sampling event. On November 6, 2023, the results were entered and assessed. It was noted that on October 3, 2023, the Courtice and Rundle Road Station Benzo(a)Pyrene (BaP) concentrations were in excess of the 24-hour AAQC as measured by the onsite PUF PS-1 samplers. Attached is a figure depicting the wind rose (indicating the wind speed and direction during the sampling day), and the location of the sampling stations relative to the DYEC.

The following summarizes the BaP concentrations and onsite conditions during the October 3 sampling date:

1. The guideline concentration for BaP is 0.05 ng/m³. The measured concentration at the Courtice sampler was 0.079 ng/m³ and the Rundle Road sampler was 0.059 ng/m³.
2. During the sampling day the wind was predominantly from the SW and the NE as recorded at the Courtice Meteorological Tower. One-hour average wind speeds at Courtice Meteorological Tower ranged from 0.9 km/h to 8.2 km/h.
3. During the sampling day the wind was predominantly from the SW as recorded at the Rundle Road Meteorological Tower. One-hour average wind speeds at Rundle Road Meteorological Tower ranged from 0.2 km/h to 12.4 km/h.
4. RWDI reviewed the available CEMS data over a 72-hour period which includes the day before and after the BaP exceedance date. The data showed no unusual readings, and all parameters were within the expected values as well as below the listed Limits. Based on the data, both boilers 1 and 2 were operating normally during the time reviewed.
5. A review of the current ESDM data shows that Benzo(a)Pyrene emissions from the DYEC for a 24-hour period are estimated to be less than 1% of the MECP limit.
6. At the time of the data review, MECP monitoring station data for BaP was not available.

Lipika Saha
Durham York Energy Centre
RWDI#2400035
November 14, 2023

7. The Courtice meteorological data suggests that the Courtice Station was primarily upwind of the DYEC during the sampling period. Given the wind conditions, it is unlikely that the measured BaP exceedance is attributable to the Energy Centre operations.
8. The Rundle Road meteorological data suggests that the Rundle Road Station was primarily downwind of the DYEC during the sampling period. Given the wind conditions, it is possible that the Energy Centre operations contributed to the measured BaP exceedance. However, due to the elevated upwind concentrations measured at the Courtice Station on this date, it is likely that there were significant contributions from surrounding industry sources.

At the Courtice Station, the NO₂ rolling mean for hourly values were less than 21% of the criteria for the same period. The PM_{2.5} 24-hour average value was 15.1 micrograms per cubic metre at the Courtice Station.

At the Rundle Road Station, the NO₂ rolling mean for hourly values were less than 11% of the criteria for the same period. The PM_{2.5} 24-hour average value was 11.5 micrograms per cubic metre at the Rundle Road Station.

We have attached the data files for the samples in question to aid with the review.

RE:	Exceedance Report – Benzo(a)Pyrene November 20, 2023 Region of Durham, DYEC	

On December 8, 2023, the results from ALS Environmental were received regarding the PAH results from the November 20, 2023, sampling event. On December 8, 2023, the results were entered and assessed. It was noted that on November 20, 2023, the Rundle Road Station Benzo(a)Pyrene (BaP) concentration was in excess of the 24-hour AAQC as measured by the onsite PUF PS-1 sampler. Attached is a figure depicting the wind rose (indicating the wind speed and direction during the sampling day), and the location of the sampling stations relative to the DYEC.

The following summarizes the BaP concentration and onsite conditions during the November 20 sampling date:

1. The guideline concentration for BaP is 0.05 ng/m³. The measured concentration at the Rundle Road sampler was 0.053 ng/m³.
2. During the sampling day the wind was predominantly from the NNW to E as recorded at the Rundle Road Meteorological Tower. One-hour average wind speeds at Rundle Road Meteorological Tower ranged from 2.45 km/h to 9.52 km/h.
3. RWDI reviewed the available CEMS data over a 72-hour period which includes the day before and after the BaP exceedance date. The data showed no unusual readings, and all parameters were within the expected values as well as below the listed Limits. Based on the data, both boilers 1 and 2 were operating normally during the time reviewed.
4. A review of the current ESDM data shows that Benzo(a)Pyrene emissions from the DYEC for a 24-hour period are estimated to be less than 1% of the MECP limit.
5. At the time of the data review, MECP monitoring station data for BaP was not available.
6. The Rundle Road meteorological data suggests that the Rundle Road Station was primarily upwind of the DYEC during the sampling period. Given the wind conditions, it is unlikely that the Energy Centre operations contributed to the measured BaP exceedance.

Lipika Saha
Durham York Energy Centre
RWDI#2400035
December 18, 2023

At the Rundle Road Station, the NO₂ rolling mean for hourly values were less than 5% of the criteria for the same period. The PM_{2.5} 24-hour average value was 2.4 micrograms per cubic metre at the Rundle Road Station.

We have attached the data files for the samples in question to aid with the review.

COMMENTS: PAH by CARB method 429 (LR option)- Isotope dilution

For the reagent blank, the recoveries of some of the labelled standards were marginally below the method control limits.
No impact to overall data quality is expected as a result.

RE:	Exceedance Report – Benzo(a)Pyrene December 14, 2023 Region of Durham, DYEC	

On January 8, 2024, the results from ALS Environmental were received regarding the Polycyclic Aromatic Hydrocarbons (PAH) results from the December 14, 2023, sampling event. On January 8, 2024, the results were entered and assessed. It was noted that on December 14, 2023, the Courtice and Rundle Road Station Benzo(a)Pyrene (BaP) concentration was in excess of the 24-hour AAQC as measured by the onsite PUF PS-1 sampler. Attached is a figure depicting the wind rose (indicating the wind speed and direction during the sampling day), and the location of the sampling stations relative to the DYEC.

The following summarizes the BaP concentration and onsite conditions during the December 14 sampling date:

1. The guideline concentration for BaP is 0.05 ng/m³. The measured concentration at the Courtice sampler was 0.113 ng/m³ and the Rundle Road sampler was 0.138 ng/m³.
2. During the sampling day the wind was predominantly from the WSW as recorded at the Courtice Meteorological Tower. One-hour average wind speeds at the Courtice Meteorological Tower ranged from 4 km/h to 30 km/h.
3. During the sampling day the wind was predominantly from the WSW as recorded at the Rundle Road Meteorological Tower. One-hour average wind speeds at the Rundle Road Meteorological Tower ranged from 2 km/h to 25 km/h.
4. RWDI reviewed the available CEMS data over a 72-hour period which includes the day before and after the BaP exceedance date. The data showed no unusual readings, and all parameters were within the expected values as well as below the listed Limits. Based on the data, both boilers 1 and 2 were operating normally during the time reviewed.
5. A review of the current ESDM data shows that BaP emissions from the DYEC for a 24-hour period are estimated to be less than 1% of the Ministry of the Environment, Conservation and Parks (MECP) limit.

Lipika Saha
Durham York Energy Centre
RWDI#2400035
January 18, 2024

6. At the time of the data review, MECP monitoring station data for BaP was not available.
7. The Courtice meteorological data suggests that the Courtice Station was upwind of the DYEC during the sampling period. Given the wind conditions, it is unlikely that the Energy Centre operations contributed to the measured BaP exceedance.
8. The Rundle Road meteorological data suggests that the Rundle Road Station was neither upwind nor downwind of the DYEC during the sampling period. Given the wind conditions, it is unlikely that the Energy Centre operations contributed to the measured BaP exceedance.
9. Given that both stations measured elevated BaP concentrations on this day, it is likely that the area experienced elevated background concentrations from another source.

At the Courtice Station, the NO₂ rolling mean for hourly values were less than 16% of the criteria for the same period. The PM_{2.5} 24-hour average value was 6.3 micrograms per cubic metre at the Courtice Road Station.

At the Rundle Road Station, the NO₂ rolling mean for hourly values were less than 13% of the criteria for the same period. The PM_{2.5} 24-hour average value was 7.5 micrograms per cubic metre at the Rundle Road Station.

We have attached the data files for the samples in question to aid with the review.

COMMENTS: PAH by CARB method 429 (LR option)- Isotope dilution

There were a number of early-eluting targets detected in both method blanks. As a result, the reported sample results for tetralin may be elevated. All other targets were detected at higher levels in the samples and not expected to be biased. In addition, the recovery of naphthalene in the laboratory control sample (LCS) is above the method control limit due to elevated sampling medium background.

For the samples, select target results have been reported from the analysis of diluted extracts due to elevated target concentrations.

Certified by:

Steve Kennedy
Technical Supervisor

Results in this certificate relate only to the samples as submitted to the laboratory.

Re: Durham York Energy Centre (DYEC)
2023 Ambient Air Q4 Sulphur Dioxide Emissions
RWDI Reference No. 2400035

In support of the 2023, Q4 Ambient Air Quality Monitoring Report prepared by RWDI Inc., the following information is provided in relation to the performance of the DYEC during the periods of elevated sulphur dioxide (SO₂) concentrations observed at the facility's Courtice and Rundle ambient air monitoring stations.

The Emission Summary and Dispersion Modelling (ESDM) report submitted as part of the DYEC ECA Application modelled SO₂ concentrations at the maximum point of impingement (POI) for a facility operating at 110% maximum continuous rating (MCR) with in-stack SO₂ concentrations at the permit limit of 35 mg/m³. Under this conservative assumed facility operating condition, the predicted maximum 1-hour average concentration at the POI was 8.62 µg/m³, which represents 8.62% of the new ambient air standard of 100 µg/m³, which was implemented in 2020.

During Q4, there were one-hundred and eighty-nine (189) exceedance events above the rolling 10-minute SO₂ Ambient Air Quality Criteria (AAQC) and seventy-eight (78) exceedance events above the rolling 1-hour SO₂ AAQC recorded at the Courtice station. There were no exceedance events above the rolling 10-minute SO₂ Ambient Air Quality Criteria (AAQC) or rolling 1-hour SO₂ AAQC recorded at the Rundle Road station.

Each of the date and times of the SO₂ AAQC exceedances were compared against the wind direction recorded at the ambient air stations as well as the SO₂ concentrations measured at the DYEC by the continuous emissions monitoring system (CEMS).

As indicated by RWDI in the 2023 DYEC Ambient Air Q4 Report, the Courtice Station pollution rose in Figure 6 shows that the majority of elevated SO₂ events at Courtice occurred from the north-northeast to northeast directions. The events were likely a result of emissions from surrounding industrial sources with contributions from the DYEC in the east-northeast direction. The Courtice station pollution rose in Figure 7 shows that <1.25% of the 5-min SO₂ events are elevated >67 ppb and the majority occurred from the north to north-northeast directions. The pollution rose indicates that the DYEC was not a contributor to SO₂ levels at the station and that the levels may be related to other industrial activity nearby.

The Rundle Road Station pollution rose in Figure 6 shows that there were no elevated SO₂ events at Rundle Road. The Rundle Road station pollution rose in Figure 7 shows that there were no 5-min SO₂ events elevated >67 ppb.

During the times the SO₂ AAQC events occurred, both boilers CEMS concentrations, comprised of 24-hour rolling arithmetic average, were recorded between 0-13 mg/Rm3. The DYEC's CEMS concentrations for both boilers were below the DYEC regulatory compliance limit of 35 mg/Rm3 and the facility was operating under normal conditions.

Re: Durham York Energy Centre (DYEC)
2023 Ambient Air Q4 Sulphur Dioxide Emissions
RWDI Reference No. 2400035

In support of the 2023, Q4 Ambient Air Quality Monitoring Report prepared by RWDI Inc., the following information is provided in relation to the performance of the DYEC during the periods of elevated sulphur dioxide (SO₂) concentrations observed at the facility's Courtice and Rundle ambient air monitoring stations.

The Emission Summary and Dispersion Modelling (ESDM) report submitted as part of the DYEC ECA Application modelled SO₂ concentrations at the maximum point of impingement (POI) for a facility operating at 110% maximum continuous rating (MCR) with in-stack SO₂ concentrations at the permit limit of 35 mg/m³. Under this conservative assumed facility operating condition, the predicted maximum 1-hour average concentration at the POI was 8.62 µg/m³, which represents 8.62% of the new ambient air standard of 100 µg/m³, which was implemented in 2020.

During Q4, there were one-hundred and eighty-nine (189) exceedance events above the rolling 10-minute SO₂ Ambient Air Quality Criteria (AAQC) and seventy-eight (78) exceedance events above the rolling 1-hour SO₂ AAQC recorded at the Courtice station. There were no exceedance events above the rolling 10-minute SO₂ Ambient Air Quality Criteria (AAQC) or rolling 1-hour SO₂ AAQC recorded at the Rundle Road station.

Each of the date and times of the SO₂ AAQC exceedances were compared against the wind direction recorded at the ambient air stations as well as the SO₂ concentrations measured at the DYEC by the continuous emissions monitoring system (CEMS).

As indicated by RWDI in the 2023 DYEC Ambient Air Q4 Report, the Courtice Station pollution rose in Figure 6 shows that the majority of elevated SO₂ events at Courtice occurred from the north-northeast to northeast directions. The events were likely a result of emissions from surrounding industrial sources with contributions from the DYEC in the east-northeast direction. The Courtice station pollution rose in Figure 7 shows that <1.25% of the 5-min SO₂ events are elevated >67 ppb and the majority occurred from the north to north-northeast directions. The pollution rose indicates that the DYEC maybe a potential contributor to SO₂ levels at the station along with other industrial activity nearby.

The Rundle Road Station pollution rose in Figure 6 shows that there were no elevated SO₂ events at Rundle Road. The Rundle Road station pollution rose in Figure 7 shows that there were no 5-min SO₂ events elevated >67 ppb.

During the times the SO₂ AAQC events occurred, both boilers CEMS concentrations, comprised of 24-hour rolling arithmetic average, were recorded between 0-13 mg/Rm3. The DYEC's CEMS concentrations for both boilers were below the DYEC regulatory compliance limit of 35 mg/Rm3 and the facility was operating under normal conditions.
