1. Introduction

The Regional Municipality of Durham, the Regional Municipality of York (collectively referred to as “the Regions”), and Reworld Durham York Limited Partnership (“Reworld”) respectfully submit the 2025 Durham York Energy Centre (“DYEC”) Annual Report, covering operations during the 2025 calendar year.

This report is being submitted in accordance with Condition 15(1) of the Environmental Compliance Approval (“ECA”) 7306-8FDKNX, which states the following:

By March 31st following the end of each operating year, the Owner shall prepare and submit to the District Manager and to the Advisory Committee, an Annual Report summarizing the operation of the Site covering the previous calendar year.

The reporting requirements in Condition 15(1) of the ECA are listed in **Table 1** together with references to the sections of this report where those reporting requirements are addressed.

The DYEC is a thermomechanical treatment facility used for the receipt of solid non-hazardous post-diversion municipal waste (“Waste”), temporary storage and thermal treatment of the Waste, abatement of the emissions from the processes and activities undertaken at the Site, handling, screening, sorting and / or conditioning of the residual wastes, and management of the wastewater and the non-contact stormwater generated at the Site. The Facility’s nominal electricity generation rate is 17.5 Megawatts and the nominal steam generation rate is approximately 67,200 kilograms per hour.

The Facility was built to operate on a continuous basis, 24 hours / day, seven days / week, except during periods of regularly scheduled maintenance. Waste may be delivered Monday through Saturday between 7:00 am to 7:00 pm. This operating schedule may be adjusted depending on demand and facility needs within the established protocol indicated in the ECA. The ECA was originally issued on June 28th, 2011, and amended on August 12th, 2014, October 24th, 2014, February 24th, 2015, December 23rd, 2015, March 14th, 2016, April 22nd, 2020, and December 23rd, 2021. The final amendment

was issued to manage the increase in Waste receipt due to the COVID-19 pandemic. This Amendment was in effect up until December 31st, 2021.

Table 1: Annual Report Requirements

ECA Condition 15		Section
(1)	By March 31st following the end of each operating year, the Owner shall prepare and submit to the District Manager and to the Advisory Committee, an Annual Report summarizing the operation of the Site covering the previous calendar year. This Annual Report shall include, as a minimum, the following information:	NA
(a)	a summary of the quality and the quantity of the Wastes accepted at the Site, including the maximum amount of the Waste received annually and daily and the sources of the Waste;	2
(b)	a summary of the quality and the quantity of the Residual Waste shipped from the Site, including the analytical data required to characterize the Residual Waste, the off-Site destinations for the Residual Waste and its subsequent use, if known;	3 Appendix 2
(c)	estimated material balance for each month documenting the maximum amount of wastes stored at the Site;	3.3
(d)	annual water usage;	4.1
(e)	annual amount of the electricity produced and the annual amount of the electricity exported to the electrical grid;	4.2

(f) summaries and conclusions from the records required by Conditions 14.(3) through 14.(8) of this Certificate;	NA
14.(3) Daily Activities The Owner shall maintain an on-Site written or digital record of activities undertaken at the Site. All measurements shall be recorded in consistent metric units of measurement. As a minimum, the record shall include the following:	NA
14.(3)(a) date of record and the name and signature of the person completing the report;	Onsite records
14.(3)(b) quantity and source of the incoming Waste received at the Site;	2.2, 2.3
14.(3)(c) records of the estimated quantity of Waste thermally treated in the Boilers;	2.3
14.(3)(d) quantity of the Unacceptable Waste received at the Site by the end of the approved Waste receipt period and the type(s) of the Unacceptable Waste received;	2.4
14.(3)(e) quantity and type of the Residual Waste shipped from the Site, including any required outgoing Residual Waste characterization results;	3.3 Appendix 2
14.(3)(f) destination and / or receiving site(s) for the Residual Waste shipped from the Site;	3.1, 3.2
14.(3)(g) quantity and type of any Rejected Waste accepted at the Site;	2.4
14.(3)(h) destination and / or receiving site(s) for the Rejected Waste shipped from the Site;	2.4
14. (3)(i) housekeeping activities, including litter collection and washing/cleaning activities, etc.	10.4

14.(3)(j)	amount of electricity produced	4.2
14.(3)(k)	amount of excess electricity exported to the electrical grid	4.2
14.(4)	Monitoring and Testing Records The Owner shall maintain an on-Site written or digital record of activities undertaken at the Site. All measurements shall be recorded in consistent metric units of measurement. As a minimum, the record shall include the following:	NA
14.(4)(a)	day and time of the activity;	Onsite records
14.(4)(b)	all original records produced by the recording devices associated with the CEM Systems;	Onsite records
14.(4)(c)	a summary of daily records of readings of the CEM Systems, including: (i) the daily minimum and maximum 4-hour average readings for carbon monoxide; (ii) the daily minimum and maximum one-hour average readings for oxygen; (iii) the daily minimum and maximum 10-minute average readings for organic matter; (iv) the daily minimum and maximum 24-hour average readings for sulphur dioxide; (v) the daily minimum and maximum 24-hour average readings for nitrogen oxides; (vi) the daily minimum and maximum 24-hour average readings for hydrogen chloride; (vii) the daily minimum and maximum 6-minute average and 2-hour average opacity readings; and (viii) the daily minimum and maximum one-hour average readings for temperature measurements.	5.1

14.(4)(d)	records of all excursions from the applicable Performance Requirements as measured by the CEM Systems, duration of the excursions, reasons for the excursions and corrective measures taken to eliminate the excursions;	5.3, 5.4
14.(4)(e)	all records produced during any Acoustic Audit;	7
14.(4)(f)	all records produced during any Source Testing;	5.5, Appendix 3, Appendix 4
14.(4)(g)	all records produced by the long-term sampling program for Dioxins and Furans required by this Certificate;	5.6
14.(4)(h)	all records produced during the Residual Waste compliance testing;	3.1, Appendix 2
14.(4)(i)	all records produced during the Soil Testing;	8
14.(4)(j)	all records produced during the Groundwater and Surface Water Monitoring required by this Certificate;	9
14.(4)(k)	all records produced during the Ambient Air Monitoring required by this Certificate;	6 Appendix 5
14.(4)(l)	all records associated with radiation monitoring of the incoming Waste, including but not limited to: (i) transaction number; (ii) hauler; (iii) vehicle ID; (iv) alarm level; (v) maximum CPS; (vi) $\mu\text{Sv} / \text{hr}$; (vii) comment;	2.4

	<p>(viii) background CPS;</p> <p>(ix) driver time in and out; and</p> <p>(x) name of the Trainer Personnel that carried out the monitoring.</p>	
14.(4)(m)	<p>results of the containment testing carried out in the buildings, conveyors, tanks and silos, as required;</p>	10.1
14. (4)(n)	<p>results the negative pressure in the Tipping Building carried out, as required.</p>	10.2
14.(5)	<p>Inspections / Maintenance / Repairs</p> <p>The Owner shall maintain an on-Site written or digital record of inspections and maintenance as required by this Certificate. As a minimum, the record shall include the following:</p> <ul style="list-style-type: none"> (a) the name and signature of the Trained Personnel that conducted the inspection; (b) the date and time of the inspection; (c) the list of any deficiencies discovered, including the need for a maintenance or repair activity; (d) the recommendations for remedial action; (e) the date, time and description of actions (repair or maintenance) undertaken; (f) the name and signature of the Trained Personnel who undertook the remedial action; and (g) an estimate of the quantity of any materials removed during cleaning of the Works. 	<p>10</p> <p>Appendix 6</p>
14.(6)	<p>Emergency Situations</p>	12

<p>The Owner shall maintain an on-Site written or digital record of the emergency situations. As a minimum, the record shall include the following:</p> <ul style="list-style-type: none"> (a) the type of an emergency situation (b) description of how the emergency situation was handled; (c) the type and amount of material spilled, if applicable; (d) a description of how the material was cleaned up and stored, if generated; and (e) the location and time of final disposal, if applicable; and (f) description of the preventative and control measures undertaken to minimize the potential for re-occurrence of the emergency situation in the future. 	
<p>14.(7) Complaints Response Records</p> <p>The Owner shall establish and maintain a written or digital record of complaints received and the responses made as required by this Certificate.</p>	13
<p>14.(8) Training</p> <p>The Owner shall maintain an on-Site written or digital record of training as required by this Certificate. As a minimum, the record shall include the following:</p> <ul style="list-style-type: none"> (a) date of training; (b) name and signature of person who has been trained; and (c) description of the training provided 	15
<p>Condition 15 (1)</p>	Appendix 3, Appendix 4

<p>(g) the Emission Summary Table and the Acoustic Assessment Summary Table for the Facility as of December 31st from the previous calendar year;</p>	
<p>(h) a summary of dates, duration and reasons for any environmental and operational problems, Boilers downtime, APC Equipment and CEM System malfunctions that may have negatively impacted the quality of the environment or any incidents triggered by the Emergency Response and Contingency Plan and corrective measures taken to eliminate the environmental impacts of the incidents;</p>	<p>11</p>
<p>(i) a summary of the dates, duration and reasons for all excursions from the applicable Performance Requirements as measured by the CEM Systems or as reported by the annual Source Testing, reasons for the excursions and corrective measures taken to eliminate the excursions;</p>	<p>5.3, 5.4</p>
<p>(j) results of the evaluation of the performance of the long-term sampling system in determining the Dioxins and Furans emission trends and / or fluctuations for the year reported on as well as demonstrating the ongoing performance of the APC Equipment associated with the Boilers;</p>	<p>5.6</p>
<p>(k) dates of all environmental complaints relating to the Site together with cause of the Complaints and actions taken to prevent future Complaints and / or events that could lead to future Complaints;</p>	<p>13</p>
<p>(l) any environmental and operational problems that could have negatively impacted the environment, discovered as a result of daily inspections or otherwise and any mitigative actions taken;</p>	<p>11</p>

(m) a summary of any emergency situations that have occurred at the Site and how they were handled;	12
(n) the results and an interpretive analysis of the results of the groundwater and surface water, including an assessment of the need to amend the monitoring programs;	9
(o) summaries of the Advisory Committee meetings, including the issues raised by the public and their current status;	14
(p) any recommendations to improve the environmental and process performance of the Site in the future;	17
(q) statement of compliance with this Certificate, including compliance with the O. Reg. 419/05 and all air emission limits based on the results of source testing, continuous monitoring and engineering calculations, as may be appropriate; and	1.1, 5.5, 6
(r) interpretation of the results and comparison to the results from previous Annual Reports to demonstrate the Facility's impact on the environment.	16

For a summary of the Environmental Assessment Notice of Approval (EA) / Environmental Compliance Approval (ECA) reports submitted to the Ministry of the Environment, Conservation and Parks (MECP) for the 2025 reporting year, refer to Appendix 1: MECP 2025 EA/ECA Report Submittals.

1.1. Statement of Compliance

During the 2025 calendar year, the DYEC operated in full compliance with the ECA.

2. Municipal Solid Waste

2.1. Waste Quality

The high quality of waste received at the Facility is achieved by implementing the following procedures:

- robust regional promotion and education programs to inform the public on how to source separate at the household level
- the provision of multiple receptacles to each household
- regionally enforced By-Laws restricting generators from placing recyclable or hazardous materials in the waste stream
- regional waste contractors are required by contract to inspect and reject unacceptable waste, if necessary, at the curbside;
- waste collected at the curbside is inspected at transfer stations before being repackaged into highway haulers and roll-offs for delivery to DYEC; and
- once per hour, a truck, if present, is unloaded onto the Tipping Building floor for a manual visual inspection before being pushed into the pit.

The design heat content of the waste is 13 MJ/kg. Due to the variability of waste, the actual estimated heat content varied throughout the year between 12.56 MJ/kg and 13.37 MJ/kg with an average of 13.08 MJ/kg. The waste received is relatively homogenous with low moisture content regardless of weather conditions. Refuse HHV (higher heating value or gross calorific / energy value energy) is monitored using a specific steam correlation equation that was developed during the acceptance tests completed in October 2015. In general, the refuse is well sorted, homogenous and has good combustion qualities.

2.2. Waste Source

Waste processed at the facility includes waste that is collected through curbside collection programs in Durham and York and through Waste Management Facilities. Curbside waste is delivered to a transfer station for inspecting and reloading into 53-foot highway hauler and 10-foot roll-offs. The following transfer stations in turn deliver the waste to the DYEC.

Regional Municipality of Durham

Brock Waste Management Facility

Miller Waste Systems - Pickering

Miller Waste Systems – Whitby

Oshawa Waste Management Facility

Scugog Waste Management Facility

U-Pak Courtice

U-Pak Pickering

U-Pak McPherson

Waste Management – Courtice

Regional Municipality of York

York Region Waste Management Centre

Earl Turcott Waste Management Facility

2.3. Waste Quantity

The ECA currently allows the facility to thermally treat 140,000 tonnes of Waste per year. The quantity of waste processed in the Boilers during 2025 was 140,000 tonnes. In 2025, DYEC received 140,168 net tonnes of waste from the aforementioned transfer stations. This value is different from the amount of acceptable waste received due to pit inventory and carry over. Refer to **Table 2**.

Table 2: Municipal Solid Waste (MSW) Material Balance (Tonnes)

Month	Durham	York	Total MSW Received	Rejected / Unacceptable MSW	Net MSW Received	Estimated Maximum Daily Onsite Storage
January						2,920
February	7,524	2,751	10,274	16.09	10,259	2,485
March	6,010	1,575	7,585	4.53	7,581	2,813
April	9,026	2,735	11,761	0.32	11,761	2,955
May	10,446	2,925	13,371	16.28	13,355	2,985
June	9,282	2,572	11,854	7.50	11,847	2,449
July	11,075	2,906	13,982	9.82	13,972	3,021
August	9,771	2,631	12,402	14.89	12,387	2,824
September	6,652	1,583	8,234	5.04	8,229	2,957
October	10,868	2,915	13,783	11.42	13,772	2,612
November	9,549	2,492	12,041	7.97	12,033	2,349
December	9,988	2,612	12,600	0.63	12,599	3,033
Total	109,845	30,416	140,265	97.14	140,168	-

Note: All weights are recorded in tonnes and rounded to whole numbers except for Rejected / Unacceptable MSW.

Condition 2(4) of the ECA limits the amount of waste that can be accepted at the Facility to 1,520 tonnes per day. The maximum amount of waste received in one day was 913.02 tonnes on May 21st, 2025.

Condition 2(5)(a) limits the maximum amount of waste that can be stored in the Waste pit to 7,350 cubic metres. The greatest amount of waste stored in the Waste Pit was

approximately 3,033 tonnes (approximately 7308.4 m³) on December 31st, 2025. (MSW density = 415 kg / m³).

2.4. Rejected Waste

Rejected waste refers to either municipal waste that cannot be processed at the Facility or waste which the site is not approved to accept. Rejected waste includes, but is not limited to, Bulky Unprocessable Items and Unacceptable Waste.

2.4.1. Unacceptable Waste

Unacceptable Waste refers to incoming waste which does not meet the incoming waste quality criteria, is of hazardous nature, and/or requires caution when handling.

The DYEC truck scale is equipped with an LFM-3 Radiation Detection System. It is a multipurpose, modular system with two remote radiation detector assemblies. The detector assemblies oppose each other so that incoming vehicles can pass between them. Radiation detected includes low, medium, and high energy gammas and X-rays (>20keV). A handheld alarming Personal Radiation Detector (PRD) is also available for use when the mounted detectors are being serviced / calibrated and to precisely locate any radioactive material within the truck when the LFM-3 system detects elevated radiation. All records associated with the radiation monitoring of incoming waste are stored and available at the DYEC.

In 2025, two loads were rejected from the facility due to elevated radiation levels. The LFM-3 radiation detector identified these loads on June 12, 2025, and August 7, 2025. The PRD was used to confirm and locate the detected radioactive material within the truck. The load was in turn rejected and returned to its transfer station of origin.

Unacceptable Waste that is not of the hazardous content is screened by the Equipment Operator and stored in a secure berm area (which ensures no adverse effects from their storage) or in a dedicated cage outside the Tip Floor. On June 11th, 2018, the MECP was notified that compressed gas cylinders removed from

incoming waste must be stored outside of the Tipping Floor in a secure cage as per an external fire safety inspection completed by the Clarington Emergency and Fire Services. On June 13th, 2018, the local Environmental Officer attended the site to verify the location of the secure cage. The Environmental Officer was satisfied with the relocation of the compressed gas cylinders to comply with the Fire Code.

Condition 4(3)(a)(iv) requires the removal of Unacceptable Waste from the Facility within 4 days of its receipt or as acceptable to the District Manager. A letter dated January 9th, 2015, from the MECP District Manager allows the DYEC to extend this storage to 90 days per Regulation 347 made under the Environmental Protection Act, R.S.O. 1990. During 2025, seven shipments of Unacceptable Waste were removed from the Facility within 90 days of generation. Refer to **Table 3** for tonnages, manifest numbers, and shipment dates for 2025.

2.4.2. Bulky Unprocessable Items

Bulky Unprocessable Items refers to incoming Waste received at the Site that cannot be processed in the Equipment. Thirty-two shipments of Bulky Unprocessable Items were removed from the Facility in 2025. These shipments included oversized items such as hot tubs, plastic totes and pipes. Refer to **Table 3** for tonnage and shipment dates.

Table 3: Rejected Waste

Date	Category	Manifest Number	Tonnes
08-Jan-25	Bulky Unprocessable		2.65
10-Feb-25	Bulky Unprocessable		7.28
25-Feb-25	Bulky Unprocessable		4.61
26-Feb-25	Bulky Unprocessable		4.20
12-Mar-25	Bulky Unprocessable		4.53
08-April-25	Unacceptable		0.32
09-May-25	Unacceptable		5.570

Date	Category	Manifest Number	Tonnes
16-May-25	Bulky Unprocessable		2.06
23-May-25	Unacceptable		5.420
29-May-25	Bulky Unprocessable		3.23
06-June-25	Bulky Unprocessable		2.71
12-June-25	Bulky Unprocessable		0.98
20-June-25	Bulky Unprocessable		2.60
24-Jun-25	Unacceptable		0.23
27-Jun-25	Unacceptable		0.980
03-July-25	Bulky Unprocessable		1.58
11-July-25	Bulky Unprocessable		4.24
17-July-25	Bulky Unprocessable		3.68
24-Jul-25	Bulky Unprocessable		0.32
01-Aug-25	Bulky Unprocessable		3.07
11-Aug-25	Bulky Unprocessable		1.14
15-Aug-25	Bulky Unprocessable		4.01
22-Aug-25	Bulky Unprocessable		2.99
28-Aug-25	Bulky Unprocessable		3.68
18-Sep-25	Bulky Unprocessable		1.98
25-Sep-25	Unacceptable	MN-000850776	0.51
26-Sep-25	Bulky Unprocessable		3.06
02-Oct-25	Bulky Unprocessable		2.22
09-Oct-25	Bulky Unprocessable		5.34
17-Oct-25	Bulky Unprocessable		1.00
23-Oct-25	Bulky Unprocessable		0.33
30-Oct-25	Bulky Unprocessable		2.53
06-Nov-25	Bulky Unprocessable		2.86
14-Nov-25	Bulky Unprocessable		1.49

Date	Category	Manifest Number	Tonnes
20-Nov-25	Bulky Unprocessable		2.41
28-Nov-25	Bulky Unprocessable		1.21
05-Dec-25	Bulky Unprocessable		0.26
19-Dec-25	Bulky Unprocessable		0.11
19-Dec-25	Unacceptable		0.26
TOTAL			97.14

Note: Only one removal required a manifest. All other shipments did not contain hazardous items.

Unacceptable Wastes were removed by Photech Environmental Solutions Inc., Waste Management System ECA – A841604, to Waste Disposal Site ECA - 6173-9UBLDJ.

Bulky Unprocessable Items were removed by Waste Management of Canada Corporation, Waste Management System ECA – A840311, and Waste Disposal Site ECA – A680243.

3. Residual Waste

Residual Waste refers to waste resulting from the waste processing activities at the Site and is limited to recovered ferrous metals, recovered non-ferrous metals, bottom ash (untreated) and fly ash (following conditioning). All Residual Waste is temporarily stored in an enclosed building prior to being removed from the Facility.

3.1. Ash

In accordance with ECA Condition 7(7)(d), the Ash Sampling and Testing Protocol dated June 2014 (the “Protocol”) was approved by the MECP and implemented on the Commencement Date of Operation, February 9th, 2015. The objectives of the sampling plans within the Protocol are listed below.

1. To confirm the bottom ash generated at DYEC meets the definition of “incinerator ash” under Ontario Regulation 347 (O.Reg 347) to ensure the materials are non-hazardous. The bottom ash should contain by weight less than 10% of combustible materials following ASTM D 5468 Standard Test Method for Gross Calorific and Ash Value of Waste Materials.
2. To confirm the fly ash sent for disposal is not leachate toxic after conditioning using the Toxicity Characteristic Leaching Procedure (TCLP), as defined in Regulation 347 and the EPA Method 1311.

In 2025, bottom ash was transported to Modern Landfill in Model City, New York while fly ash was transported to Walker Environmental Group – South Landfill in Thorold, Ontario. Both bottom and conditioned fly ash are mixed with soil and used as daily / interim cover.

3.1.1. Bottom Ash

The Bottom Ash Handling System receives and transports water-quenched bottom ash from the ash discharger to the Residue Storage Building. The Bottom Ash Handling System also includes equipment that provides for the separation of ferrous and non-ferrous metals from the bottom ash residue stream. The Residue Storage Building is the temporary storage destination for all bottom ash residue and recovered metals before subsequent off-site removal.

During post commissioning operations, the bottom ash Comprehensive Ash Sampling Test Program (CASTP) consisted of sampling for five days yielding 4 daily composite samples for a total of 20 subsamples for submission to the laboratory for analysis. This process was repeated on an annual basis, until the compliance testing results indicated that the bottom ash met the "incinerator ash" definition set forth by O.Reg 347 for three (3) consecutive years. The first triennial CASTP was executed on November 11th, 2017, the second triennial on October 24th, 2020, and the third triennial on December 2nd, 2023.

A statistical analysis of the data is used to determine if the bottom ash has less than 10% combustible materials. This statistical evaluation follows the calculation procedures specified by US EPA, SW-846, *“Test Methods for Evaluating Solid Waste, Physical / Chemical Methods”*.

To ensure consistent bottom ash quality between the conduct of the subsequent CASTPs, on a quarterly basis, a one-day sample program is performed. The results are “rolled up” with the data collected subsequently to and including the last CASTP and evaluated in accordance with the statistical procedures stated above. In 2025, quarterly samples were performed on February 11th, June 2nd, August 22nd , and November 11th, 2025.

The results in 2025 demonstrated the bottom ash continued to meet the “incinerator ash” definition, thus it could be managed as a non - hazardous solid waste. The ash continues to be used as daily cover.

To comply with the requirements of the National Pollutant Release Inventory (NPRI), samples were collected on a quarterly basis to determine pollutant releases to land. The samples were collected on February 11th, June 2nd, August 22nd, and November 11th, 2025.

Refer to **Appendix 2** for sampling results, statistical summaries, and plant operating conditions.

3.1.2. Fly Ash

The Fly Ash Handling System transports fly ash from the boiler and the Air Pollution Control (APC) system to the Residue Storage Building. It is conveyed into one of two surge bins from which it is metered into one of two pugmills for conditioning and stabilization. Stabilization of the fly ash requires a blend of pozzolanic material, Portland cement, and water. The pozzolan and cement are stored in silos located exterior to the Residue Storage Building. The two reagents are metered via rotary valves and conveyed into the pugmills through a shared conveyor. Water is added directly in the pugmills to aid with the thorough mixing of fly ash, pozzolan, and

cement to ensure microencapsulation. The ash mixture is discharged into the first of seven fly ash bays and kept on site for a sufficient time to allow the treatment reaction to complete before it is shipped to landfill for disposal. All reported weights for this material are inclusive of these reagents.

During post commissioning operations, the fly ash CASTP consisted of sampling for five days yielding 4 daily composite samples for a total of 20 samples for submission to the laboratory for analysis. This process was repeated for three (3) consecutive years to demonstrate compliance that no TCLP thresholds for the constituents analyzed have been exceeded. The first triennial CASTP, post annual demonstration of compliance, was executed from November 11th to November 15th, 2017. The second triennial CASTP was executed from November 21st to November 25th, 2020. The third triennial CASTP was executed from October 28th to November 1st, 2023.

There were no shipments of untreated fly ash from the Facility during 2025. The ash continues to be used as daily cover.

On a quarterly basis, to comply with the requirements of the NPRI, samples are collected to determine pollutant releases to land. The samples were collected on February 11th, June 2nd, August 22nd, and November 11th, 2025.

3.2. Metals

In 2025, recovered ferrous and non-ferrous metals were shipped to Triple M Metal LP at their Brampton location. There are no analytical requirements for the ferrous and non-ferrous metal streams leaving the DYEC. Ferrous and non-ferrous tonnages are summarized in **Table 4**.

3.3. Residual Waste – Material Balance

ECA Condition 2(5)(c to f) describes maximum storage restrictions for Residual Wastes. Amended by Notice 5 dated March 14th, 2016, the maximum storage durations were removed. The maximum storage limit for bottom ash is 630 tonnes,

for fly ash is 700 tonnes, for ferrous metal is 77 tonnes, and for non-ferrous metal is 120 tonnes.

A material balance was prepared showing the amount of Residual Waste shipped per month and the daily maximum amount of waste stored on site per month. Refer to **Table 4** and **Table 5**.

Table 4: Residual Waste Shipments (Tonnes)

Limit / Month	Bottom Ash	Fly Ash	Ferrous	Non-Ferrous
January	2,092	694	237	80
February	1,534	467	229	36
March	1,165	591	188	27
April	1,887	679	263	73
May	2,570	819	242	33
June	2,277	703	172	32
July	2,253	797	373	34
August	2,038	722	291	32
September	1,496	611	186	59
October	2,438	892	311	32
November	2,112	688	335	31
December	1,888	695	328	26
Total	23,749	8,359	3,155	493

Note: All weights are rounded to whole numbers.

Table 5: Residual Waste Daily Maximum Storage (Tonnes)

Limit / Month	Bottom Ash	Fly Ash	Ferrous	Non-Ferrous
January				45
February	383	213	39	44
March	360	261	40	28
April	339	252	57	25
May	387	261	74	23

Limit / Month	Bottom Ash	Fly Ash	Ferrous	Non-Ferrous
June	297	264	62	35
July	385	294	62	35
August	514	290	70	29
September	438	316	34	32
October	627	323	55	41
November	512	352	52	26
December	496	400	30	22

Note: All weights are rounded to whole numbers.

4. Utilities

4.1. Water

The DYEC is a zero-process water discharge facility, and as such, no water from the process is sent to the sanitary sewer system or discharged into the environment. Under normal operations, the DYEC operates at a water deficit and requires water supplied from the Region of Durham’s municipal water system. Wastewater generated by the Facility (except for sanitary discharges) is re-used in the process to cool flue gas and condition bottom and fly ash. Make up water is required to replenish these processes.

During 2025, 31,082 m³ of water was drawn from the municipal water system.

4.2. Electricity

During 2025, the turbine generated 116,762 MWh of electricity of which 99,504 MWh were exported to the grid.

5. Air Emissions

5.1. Continuous Emission Monitoring System (CEMS)

The CEMS installed at the DYEC meets the Installation and Performance Parameters listed in Schedule F of the ECA. The purpose of the CEMS is to continuously monitor

flue gas to maximize Boiler combustion efficiency and minimize emissions. The system is equipped to display current values, perform calibration checks, generate daily reports showing minimum, maximum, and average readings, and display system status and emissions alarms. Data collected from this system is available to the public via the Region of Durham's website in accordance with ECA Condition 16 – Public Access to Documentation and is also displayed on the LED display board on the front of the DYEC Visitors Centre.

The CEMS and Data Acquisition System (“DAS”) measure and record concentrations on a dry-basis for carbon monoxide (CO), oxygen (O₂), sulfur dioxide (SO₂), nitrogen oxides (NO_x), ammonia (NH₃), hydrogen chloride (HCl), hydrogen fluoride (HF), total hydrocarbons / organic matter (THC), temperature, and mass flow of flue gas. The DAS also measures and records concentrations for moisture (H₂O) and opacity. The location of the analysis sampling points were intentionally selected to allow the efficiency of the APC system to be closely monitored. Flue gas is analyzed prior to entering the APC evaporative cooler (Quench Inlet) as well as in the APC outlet/induced fan inlet duct (Baghouse Outlet) of each Boiler. Records of daily minimum, maximum, and average readings for CO (4-hour average), O₂, combustion and baghouse temperature (one-hour average), organic matter (10-minute average), SO₂, NO_x, HCl and HF (24-hour average), and opacity (6-minute and 2-hour average) are available at the site. Refer to **Table 6** and **Table 7** for Annual Emission Summaries.

A Relative Accuracy Test Audit (“RATA”) and associated system bias performance evaluations were completed on August 28th, 2025, for Boiler 1 and August 26th, 2025 & August 27th, 2025, for Boiler 2. The RATA was completed while the Facility was operating at greater than 50% of the full thermal capacity as required by Environment Canada Report EPS 1/PG/7. Based on the RATA and associated system bias performance evaluation, all parameters met the criteria specified in Schedule F of the ECA.

Table 6: Boiler 1 Annual Emission Summary

Parameters	Averaging Periods	Units	Approval Limit	Minimum	Maximum	Average
Carbon Monoxide	4-hour rolling	mg / Rm ³	40	2	35	14
Opacity	2-hour rolling	%	5	0	2	0
Opacity	6-minute rolling	%	10	0	7	0.25
Oxygen	1-hour	%	≥6	6	22	7
Sulphur Dioxide	24-hour	mg / Rm ³	35	0	17	1
Nitrogen Oxides	24-hour	mg / Rm ³	121	90	115	108
Hydrogen Chloride	24-hour	mg / Rm ³	9	0	5	2
Combustion Temperature	1-hour	°C	≥1000	1024	1433	1231
Baghouse Temperature	1-hour	°C	>120 and <185	120	153	143
Organic Matter (THC)	10-minute	mg / Rm ³	NA	0	65	0.76

NOTE: Compliance of Organic Matter (THC) is monitored during source testing.

Table 7: Boiler 2 Annual Emission Summary

Parameters	Averaging Periods	Units	Approval Limit	Minimum	Maximum	Average
Carbon Monoxide	4-hour rolling	mg / Rm ³	40	2	38	14

Parameters	Averaging Periods	Units	Approval Limit	Minimum	Maximum	Average
Opacity	2-hour rolling	%	5	0	4	1
Opacity	6-minute rolling	%	10	0	6	1
Oxygen	1-hour	%	≥6	6	14	8
Sulphur Dioxide	24-hour	mg / Rm ³	35	0	23	2
Nitrogen Oxides	24-hour	mg / Rm ³	121	78	113	108
Hydrogen Chloride	24-hour	mg / Rm ³	9	0	5	2
Combustion Temperature	1-hour	°C	>1000	1034	1493	1201
Baghouse Temperature	1-hour	°C	>120 and <185	122	151	141
Organic Matter (THC)	10-minute	mg / Rm ³	NA	0	65	1.27

NOTE: Compliance of Organic Matter (THC) is monitored during source testing

5.2. Analyser Reliability

Schedule F of the ECA specifies the continuous monitoring and recording systems used to measure and record the temperature and emissions from the Boilers. The monitors for carbon monoxide, oxygen, hydrogen chloride, nitrogen oxides, sulfur dioxide, total hydrocarbons, opacity, and combustion zone temperature are required to be operated and maintained so that accurate data is obtained during a minimum of 95 percent of the valid hours for each boiler for each calendar quarter in accordance with the ECA and EPS 1/PG/7. For the purposes of reliability calculations, EPS 1/PG/7 defines a valid hour to be an hour during which the generating unit burned fuel and

the associated continuous emission monitoring system produced a minimum of 30 minutes of valid data.

Based on the definition above, reliability for 2025 was calculated for each Boiler, for each calendar quarter. The Continuous Emissions Monitoring System (CEMS) performance in 2025 was throughout each quarter. Refer to **Table 8**.

Table 8: Continuous Emission Monitoring Systems Analyser Reliability (%)

Boiler 1	O _{2e}	SO ₂	HCl	NO _x	CO	Opacity	THC	Combustion Temperature
Quarter 1	100	99	99	99	99	100	99	100
Quarter 2	100	99	99	99	99	100	99	100
Quarter 3	100	100	100	100	100	100	99	100
Quarter 4	100	99	98	99	99	100	99	100

Boiler 2	O _{2e}	SO ₂	HCl	NO _x	CO	Opacity	THC	Combustion Temperature
Quarter 1	97	99	99	99	99	100	98	100
Quarter 2	100	99	99	99	99	100	98	100
Quarter 3	99	99	98	99	99	100	97	100
Quarter 4	99	98	98	98	98	100	98	100

Note: O_{2e} means O₂ measured at the Economizer Outlet.

5.3. Performance Requirements (Schedule C) - Excursions

During 2025, there were no excursions to Performance Requirements as listed in Schedule C.

5.4. Performance Requirements (Condition 6) Excursions

During 2025, there were no excursions to Performance Requirements as listed in Condition 6.

5.5. Source Testing

Source testing refers to monitoring, sampling, and testing to determine rate of emission of the Test Contaminants listed in Schedule D of the ECA. The procedures and schedule outlined in Schedule E of the ECA were followed and the Facility was confirmed to be within the operating parameters defined by the ECA. The results of these programs are summarized below. Full reports are available on the DYEC website, in accordance with the ECA.

5.5.1. Voluntary Source Test (VST)

Alliance Technical Group completed a VST at the DYEC between October 27th and October 30th, 2025, to satisfy the requirement put forth by Durham Region Council to perform emission testing twice per year.

Voluntary source testing was performed on the Quench Inlets and Baghouse Outlets of both Boiler 1 and Boiler 2 for the test contaminants listed in Schedule “D” of the ECA.

The average results for the tests conducted along with the respective in-stack emission limits are summarized in **Table 9**.

Table 9: Voluntary Source Test Summary

Parameter	Limit	Boiler 1	Boiler 2
Total Suspended Particulate Matter (filterable)			<0.35
Cadmium	7 µg / Rm ³	0.078	0.037
Lead	50 µg / Rm ³	0.90	0.62
Mercury	15 µg / Rm ³	<0.067	<0.063

Parameter	Limit	Boiler 1	Boiler 2
Dioxins and Furans			<1.55
Organic Matter	50 ppm _{dv}	0.76	0.53
Hydrochloric Acid	9 mg / Rm ³	0.8	0.8
Sulphur Dioxide	35 mg / Rm ³	1.4	1.4
Nitrogen Dioxide	121 mg / Rm ³	109	109
Carbon Monoxide	40 mg / Rm ³	13.5	13.4

Note: Reference Conditions are dry and 25°C and 1 atmosphere, adjusted to 11% oxygen by volume.

5.5.2. Compliance Source Test

Alliance Technical Group completed an emission testing program at the DYEC between May 12th and May 15th, 2025 and on July 10th, 2025 to satisfy the requirements of ECA Condition 7(1).

Compliance source testing was performed on the Quench Inlets and Baghouse Outlets of both Boiler 1 and Boiler 2 for the test contaminants listed in Schedule “D” of the ECA.

The average results for the tests conducted along with the respective in-stack emission limits are summarized in **Table 10**.

Table 10: Compliance Source Test Summary

Parameter	Limit	Boiler 1	Boiler 2
Total Suspended Particulate Matter (filterable)	9 mg / Rm ³	<0.29	<0.34
Cadmium	7 µg / Rm ³	0.029	<0.024

Parameter	Limit	Boiler 1	Boiler 2
Lead	50 µg / Rm ³	0.26	0.26
Mercury	15 µg / Rm ³	<0.13	<0.13
Dioxins and Furans	60 pg / Rm ³	<2.56	<2.61
Organic Matter	50 ppm _{dv}	0.67	0.16
Hydrochloric Acid	9 mg / Rm ³	2.1	3.3
Sulphur Dioxide	35 mg / Rm ³	2.6	5.2
Nitrogen Dioxide	121 mg / Rm ³	109	109
Carbon Monoxide	40 mg / Rm ³	10.6	13.6

Note: Reference Conditions are dry and 25°C and 1 atmosphere, adjusted to 11% oxygen by volume.

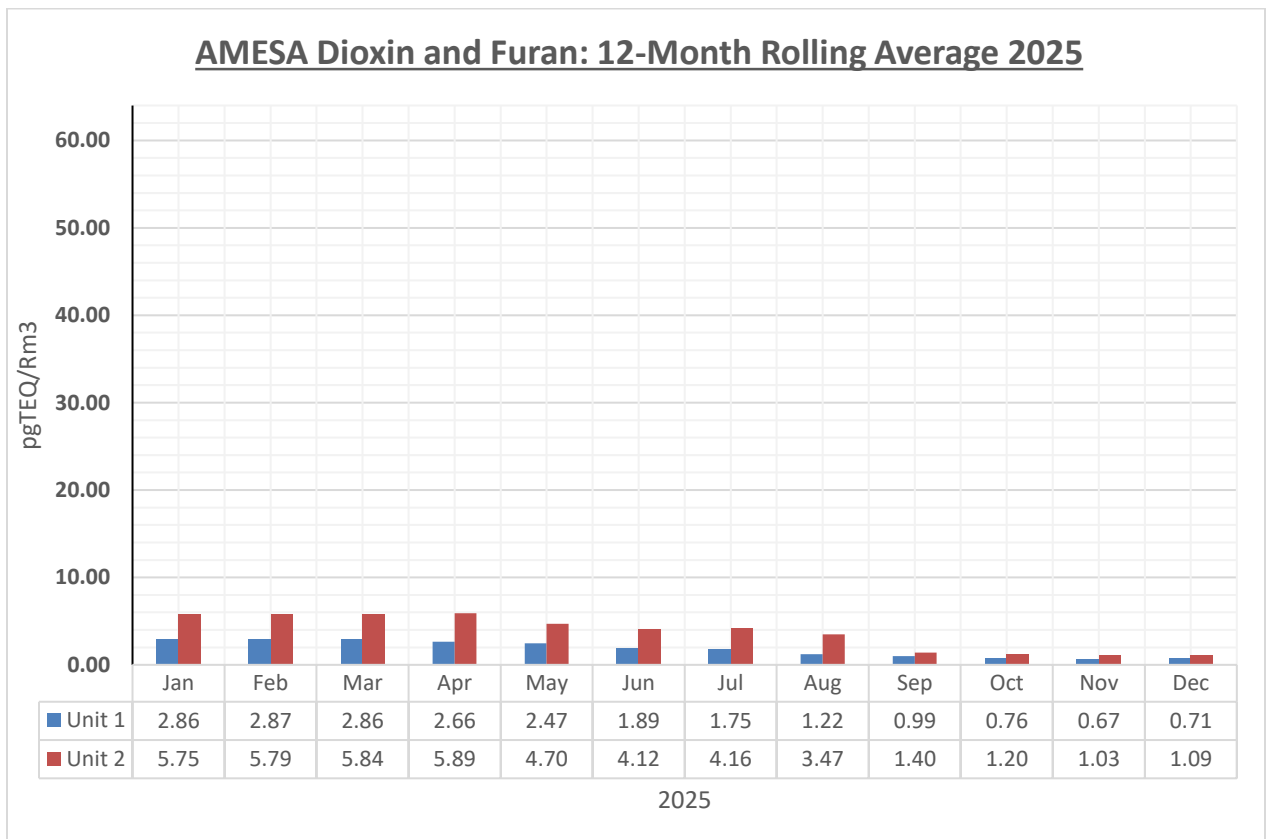

Test results from Voluntary and Compliance Source Testing indicate that the DYEC demonstrated compliance with all respective in-stack ECA limits. The predicted maximum point of impingement concentrations, based on the average test results for both boilers, were calculated using CALPUFF Dispersion Model Version 7.2.1, show the facility to be operating well below all current standards in Regulation 419/05. Refer to Appendix 4.

5.6. Long Term Dioxin and Furan Sampling System (LTSS)

The AMESA (Adsorption Method for Sampling) system, installed on each of the two units at DYEC, is a dioxin and furan continuous sampling system designed to meet the requirements of the ECA Condition 7(3). The system is used to trend sample analysis results and evaluate the ongoing performance of the APC equipment. All laboratory analyzed resultant values obtained from the AMESA samples, regardless of short-term or long-term sampling periods, are not used for verifying compliance with the regulatory limits for dioxins and furans.

In 2025, the AMESA sampler was installed on both units to collect data for performance evaluation during long-term sampling (+/- 28-day periods) as dictated by the operational availability of each Unit.

To properly track APC equipment performance, data points from the sampling runs were used to calculate 12-month rolling averages. The averages for 2025 are presented below.

The Level of Quantification (LoQ) or the lowest concentration that can be accurately measured using sensitive but routine sampling and analytical methods is 32 pgTEQ/Rm³ @ 11%O₂ (Environment Canada, 1989). Data points outside of the Target Range threshold of greater than 100% of the LOQ were assessed to ensure only valid data points were used in the calculation of a rolling average. This follows the intended path forward established in the 2021 AMESA Workplan Summary Report. In 2025, AMESA sample runs consistently produced reliable results throughout the year.

The averages obtained from the AMESA sample runs illustrate the capable performance of the APC system to minimize emissions. In the event the 12-month rolling average exceeded greater than 100% of the LOQ (64 pgTEQ/Rm³ @ 11%O₂), operation of the Boiler and APC equipment would have been verified in conformance with the principles of the 2016 Abatement Plan.

In summary, the ongoing performance of the APC equipment has been successfully demonstrated in accordance with ECA condition 7(3)(b) using certified procedures applicable to source testing and the CEMS for 2025. The AMESA analysis resultant values provide a degree of confidence in modelling process performance. On occasions, anomalous data points will occur due to conditions not representative of steady-state operation and isokinetic sampling which triggers a detail and thorough examination of plant processes. Both voluntary and compliance source testing demonstrated full compliance with all ECA Performance Requirements (Schedule C). These results are presented in **Section 5.5** of the Annual report.

6. Ambient Air Monitoring

Ambient air monitoring is a requirement of Condition 11 of the Environmental Assessment (EA) and Condition 7(4) of the ECA. Ambient air monitoring is undertaken in accordance with the Ambient Air Monitoring Plan approved by the MECP in May 2012. There are two ambient air monitoring stations. An upwind station located in close proximity to the southwest of the DYEC at the Courtice Water Pollution Control Plant (Courtice WPCP) collects potential contaminant data at a predominantly upwind location. A downwind station located northeast of the DYEC near the intersection of Baseline Road and Rundle Road, collects contaminant data in the most dominant wind direction. For a summary list of the ambient air monitoring stations and monitoring parameters, refer to **Table 12**. See Appendix 5 for ambient air monitoring station locations.

Table 12: Ambient Air Monitoring Program Summary

Monitoring Station	Meteorological Data	Continuous Parameters	Non-Continuous Parameters
Upwind (Courtice (WPCP))	<ul style="list-style-type: none"> • Wind speed and direction (@10 metres) • Ambient temperature • Relative humidity • Rainfall • Barometric Pressure 	<ul style="list-style-type: none"> • Sulfur Dioxide (SO₂) • Nitrogen Dioxide (NO₂) • Particulate Matter (PM_{2.5}) 	<ul style="list-style-type: none"> • Metals • Total Suspended Particulate Matter (TSP) • Polycyclic Aromatic Hydrocarbons (PAH's) • Dioxins and Furans
Downwind (Baseline and Rundle Road)	<ul style="list-style-type: none"> • Wind speed and direction (@10 metres) • Ambient temperature • Relative humidity • Rainfall 	<ul style="list-style-type: none"> • Sulfur Dioxide (SO₂) • Nitrogen Dioxide (NO₂) • Particulate Matter (PM_{2.5}) 	<ul style="list-style-type: none"> • Metals • Total Suspended Particulate Matter (TSP) • Polycyclic Aromatic Hydrocarbons (PAH's) • Dioxins and Furans

Quarterly and annual ambient air reports have been submitted to the MECP since the start of the monitoring program in 2013 per their respective due dates outlined in the Operations Manual for Air Quality Monitoring in Ontario (Ministry of Environment and Climate Change, 2018). The 2025 Annual Ambient Air Monitoring report is due to the MECP by May 15th, 2026. All reports are publicly available on the DYEC website in accordance with ECA Condition 7(4)(c). All contaminants were below their applicable

MECP criteria as well as applicable Human Health Risk Assessment (HHRA) health-based standards with exceptions listed below in **Table 13**.

Table 13: Ambient Air Monitoring Quarterly Summary of Exceedances

Quarter	Parameter exceeded	Courtice Road Station events	Rundle Road Station events
Quarter 1	Benzo(a)pyrene	0	0
	Sulphur Dioxide 10 minute	45	0
	Sulphur Dioxide 1 hour	22	0
Quarter 2	Benzo(a)pyrene	0	0
	Sulphur Dioxide 10 minute	51	0
	Sulphur Dioxide 1 hour	20	0
Quarter 3	Benzo(a)pyrene	0	0
	Sulphur Dioxide 10 minute	24	0
	Sulphur Dioxide 1 hour	17	0
Quarter 4	Benzo(a)pyrene	2	3
	Sulphur Dioxide 10 minute	51	0
	Sulphur Dioxide 1 hour	32	0

A review of the stack continuous emissions monitoring data on the dates exceedances were recorded indicate that there were no unusual emission levels from the DYEC Continuous Emissions Monitoring Systems (CEMS) and no operational issues.

The current Ontario 24-hour Ambient Air Quality Criterion for benzo(a)pyrene was introduced in 2011 and levels above this threshold are commonly measured throughout Ontario. However, the benzo(a)pyrene measurements noted above were well below the MECP Schedule 6 Upper Risk Threshold and the MECP O.Reg. 419/05 24-hour average guideline.

New Ambient Air Quality Criteria (AAQC) for Sulphur dioxide were implemented in 2020, including a 10-minute rolling average AAQC of 67 parts per billion (ppb), a 1-hour rolling average AAQC of 40ppb and an annual AAQC of 4 ppb. Elevated concentrations of sulphur dioxide continue to be reported within the ambient air quarterly reports.

7. Noise Monitoring

On June 27th, 2017, a revised Noise Monitoring and Reporting Plan was submitted to the MECP. Acknowledgement was received from the MECP on September 21st, 2017. The revised report recommended the removal of the requirement to conduct annual acoustic measurements. This requirement was revoked by the MECP on February 24th, 2016, by Amendment Notice Number 4. The requirement for undertaking acoustic auditing could be reinstated if significant changes to facility operations with the potential to alter noise generation are proposed, or at the request of the MECP.

An annual review of the Noise Monitoring and Reporting Plan was completed in August 2025. No modifications to the Plan were required.

8. Soil Testing

Soil testing is required under Condition 7(10), 13(4) and 15(4) of the ECA and is undertaken in accordance with the Durham York Energy Centre Soils Testing Plan approved by the MECP in March 2013. In accordance with the approved plan, the parameters tested include metals, polycyclic aromatic hydrocarbons (PAHs), and dioxins and furans (PCDDs/PCDFs). Soil samples are evaluated against Table 1 Full Depth Background Site Condition Standards-Soil, of the Ground Water and Sediment Standards for Use Under part XV.1 of the *Environmental Protection Act*.

Soil testing commenced in August 2013 to quantify baseline contaminant concentrations prior to DYEC operations. Soil sampling and ambient air monitoring occur at the same locations, as required by Condition 13(4)(a) of the ECA and the approved Soils Testing Plan. Soil testing is performed once during each of the first three years of operation, and

every three years thereafter until notification is received from the MECP Regional Director advising that soil monitoring is no longer required.

The most recent soils testing event was carried out on August 14, 2023. Results were documented in a Soils Testing Report dated November 3, 2023. A technical memorandum from the Ministry's Terrestrial Assessment and Field Services Unit was sent to the Regions on June 17, 2025, following a review of the 2023 Soil Testing Report. A response to the review comments was prepared and submitted to the Ministry in a letter dated July 15, 2025.

The next soil testing event is scheduled to be undertaken in August 2026.

Results from all soils testing events are available to the public on the DYEC website.

9. Groundwater and Surface Water Monitoring

Groundwater and surface water monitoring is a requirement of the EA Condition 20 and the ECA Condition 7(14). Monitoring is conducted in accordance with the Durham York Energy Centre Groundwater and Surface Water Monitoring Plan approved by the MECP in October 2011. The monitoring program started in December 2011, prior to the commencement of facility operations to collect background water quality data.

9.1. Surface Water Monitoring Results

In April 2016, the Regions requested a suspension of the surface water monitoring due to construction of the Courtice Road and Highway 401 interchange and the Tooley Creek realignment activities undertaken by the Ministry of Transportation. This caused significant disruption and prevented the placement of sondes in Tooley Creek. In a response letter dated May 17th, 2016, the MECP granted the request and concurred with the interpretation of the surface water results to date. As a result, no in-situ surface water sampling occurred in the upstream or downstream locations within Tooley Creek from 2017-2023.

In 2024 in-situ surface water monitoring resumed in locations very close to the original locations for both upstream and downstream locations. The surface water

monitoring event was conducted from August 2, 2024, to November 7, 2024. The results of this monitoring program were compiled in the Groundwater and Surface Water Monitoring Report, which was submitted to the MECP on April 30, 2025.

The findings confirmed that there was no measurable influence from the Durham York Energy Centre (DYEC) operations on surface water quality during the monitoring period.

9.2 Groundwater Monitoring Results

Groundwater samples are collected annually in the fall through a series of dedicated on-site monitoring wells. In 2024, the groundwater analytical results for the required parameters of analysis showed that all parameters met their respective Ontario Drinking Water Standards (ODWS), except for elevated sodium and chloride levels at monitoring well MW4. An assessment of groundwater flow patterns and analytical results from downgradient wells located closer to the Durham York Energy Centre (DYEC) confirms that the elevated sodium at MW4 cannot be attributed to DYEC waste treatment operations.

The elevated sodium and associated chloride trends observed at MW4 are interpreted to result from the seasonal exfiltration of salt-impacted stormwater from the East Stormwater Management Pond (SWMP). This pond receives roadway and parking lot runoff affected by winter de-icing activities. Due to the relatively permeable sandy silt underlying the area, this impacted water can migrate into the screened interval of MW4. The chloride trend, which began increasing around 2016, supports this interpretation and reflects the time required for salt-impacted water to accumulate in the SWMP and subsequently migrate through the subsurface.

A review of both 2024 and historical groundwater data indicates that DYEC operations have not adversely affected groundwater quality at the Site. Historical inspections show MW4 is properly sealed and protected from direct runoff. In contrast, nearby monitoring nest MW3 is in less permeable soils and does not show similar impacts.

An interpretive analysis for the 2024 groundwater and surface water monitoring activities was discussed in the groundwater and surface water annual report. This report, covering the 2024 monitoring period, was submitted to the MECP on April 30th, 2025, in accordance with the “Submission of Groundwater Well Development” letter dated January 28th, 2013, and the MECP acknowledgment letter dated March 4th, 2013.

Further discussion on the assessment of the monitoring plan and the need for amendments for 2025 was included in the annual groundwater and surface water report with supporting documentation. If any amendments are recommended, it will be discussed with the MECP.

Refer to **Table 14** for the groundwater well and in-situ surface water sonde locations and parameters tested.

Table 14: Groundwater and Surface Water Monitoring Program Summary

Groundwater Well ID	Groundwater Well Location	Monitoring Parameters
MW1	Northwest corner of site	Field Measurements, Major Anions, Major Cations, Metals
MW2A & 2B (nested)	Northeast corner of site	Field Measurements, Major Anions, Major Cations, Metals
MW3A & 3B (nested)	Southwest corner of site	Field Measurements, Major Anions, Major Cations, Metals
MW4	Southeast corner of site	Field Measurements, Major Anions, Major Cations, Metals
MW5 & 5B (nested)	Centre of site	Field Measurements, Major Anions,

Groundwater Well ID	Groundwater Well Location	Monitoring Parameters
		Major Cations, Metals

Surface Water Sonde ID	Sonde Location	Monitoring Parameters
SW01	Upstream in Tooley Creek	Field Measurements
SW02	Downstream in Tooley Creek	Field Measurements

The 2024 groundwater and surface water monitoring activities meet the compliance requirements of the EA, the ECA and the approved Groundwater and Surface Water Monitoring Plan. Groundwater and surface water monitoring results and correspondence available to date are posted on the DYEC website in accordance with ECA Condition 16 – Public Access to Documentation.

10. Inspections Maintenance and Repairs

10.1. Containment Protocol Inspections

The ECA outlines requirements to confirm the effectiveness of the containment of conveyors, tanks, and silos in various buildings on site, by conducting inspections, testing and / or engineering reviews. Initial containment testing (including negative pressure / smoke test of the Tipping Building) was conducted in 2014. The DYEC Containment Test Protocol, revised in September 2014, lists additional subsequent periodic inspections to be conducted.

All subsequent periodic inspections were conducted in accordance with the requirements outlined in **Table 15**.

Table 15: Containment Periodic Inspections

Containment Enclosure	Periodic Inspection
Tipping Building	<ul style="list-style-type: none"> • Calibration of boiler combustion air flow venturi transmitter
Refuse Pit	<ul style="list-style-type: none"> • Ground water monitoring
Grizzly and Residue Buildings	<ul style="list-style-type: none"> • Daily general inspections • Quarterly USEPA Method 22

Cement and Pozzolan Silos	<ul style="list-style-type: none"> • Daily general inspections • Quarterly USEPA Method 22
Diesel Fueling Station	<ul style="list-style-type: none"> • Daily general visual inspections
Fire Pump Diesel Tanks	<ul style="list-style-type: none"> • Daily general visual inspections
Exterior Bottom and Fly Ash Conveyors	<ul style="list-style-type: none"> • Daily general inspections • Quarterly USEPA Method 22
Settling Basin	<ul style="list-style-type: none"> • Daily general visual inspections • Groundwater monitoring

10.2. Combustion Air Flow – Negative Pressure

While the Boilers are in operation, combustion air flow is maintained through the Tip Hall and pit area. The Facility induces airflow through the Tipping Building and across the pit by pulling air used for combustion through intake ducts located above the hoppers on the charging deck via forced draft fans. A system of louvers is adjusted according to prevailing operating conditions, such as the number of Boilers in operation and if MSW is being delivered. Louver positions for various Boiler operating scenarios were developed during the 2014 containment (smoke) test. Regular

maintenance and inspection activities are performed to confirm the building envelope remains in good condition as well as the functionality of all doors and roof vents. The doors and louvers are inspected daily for proper operation. These activities ensure odour is effectively contained within the confines of the Tipping Building.

The continuous monitoring of the combustion airflow rate through the Tipping Building is a surrogate for confirming that induced air flow is being maintained within the building. Temperatures, pressures, and flow rates are monitored throughout the combustion air and flue gas path in both units. Combustion airflows (1/2-FIT-4202) in each of the two thermal treatment units are monitored continuously to ensure proper airflow (odour containment) in the Tipping Building. As operating conditions change (i.e., shutdowns, non-delivery times), the airflow is adjusted with the use of louvers on the north wall of the Tipping Building to maintain sufficient airflow to prevent odorous air from leaving the building. An alarm indicator on the Distributed Control System (DCS) will alert the control room operator of low combustion air flows requiring possible louver repositioning as necessary. Periodic inspection and annual verification of the combustion air flow transmitters is conducted in accordance with the Containment Test Protocol.

10.3. Maintenance Review

Planned maintenance and inspection activities are an integral part of maintaining all plant processes and equipment. Reworld uses the PeopleSoft Asset Lifecycle Management system to track all maintenance and preventative maintenance activities at the DYEC. These activities include work identification, planning, scheduling, execution, detailing and cost-control, inventory management, preventative maintenance, purchasing, and equipment asset management. All critical equipment is systematically and repetitively inspected and tested. Critical equipment is also subjected to a systematic and detailed program of preventative maintenance repair and replacement. The system auto-generates work orders for all scheduled maintenance activities.

In 2025, scheduled preventative maintenance activities were completed on the Boilers, APC equipment, CEMS and other auxiliary systems. See Appendix 6 for details.

10.4. Inspection Summaries

Records of activities are written or digital and include the date of record and the name and / or signature of the person completing the report.

An outside environmental checklist is completed by an operator daily to fulfill the requirements of ECA Condition 5(5) - Inspections. The weekly environmental inspection is completed by the Facility's Environmental Manager through Ideagen, a cloud based Environmental, Health, and Safety platform. A facility wide housekeeping initiative is also in place. After every scheduled outage, the facility hires a third-party cleaning service to clean the floors of the boiler building and uphold our housekeeping standards.

All records are available at the site and will be retained on site for a minimum of seven (7) years from the date of their creation, per ECA Condition 14(2).

No environmental or operational problems that could have negatively impacted the environment were identified during these inspections in 2025.

10.5. Sewage Works

In accordance with ECA Condition 5, Inspections and Maintenance of the Works, (7), the Owner shall inspect the Works at least once a year and, if necessary, clean and maintain the Works to prevent the excessive build-up of sediments and / or vegetation.

The annual sewage works inspection was performed on October 10th, 2025. No deficiencies were found.

11. Operational Issues and Mitigation Measures

Under normal circumstances with at least one Boiler in operation, the Facility maintains odour containment within the waste storage area (Tipping Building pit) by drawing

combustion air from inside the building, which prevents odours from escaping. In cold iron outage situations, where both Boilers are offline, odour control mitigation measures are implemented to minimize any potential offsite environmental impacts. Mitigation measures include diverting waste for disposal to alternate locations, misting micronutrients over the pit area and conducting regular on-site and off-site inspections to check for fugitive odours.

The DYEC entered emergency shutdown on the dates listed below.

Date	Duration	Cause
July 13th	12.8 hours	Utility Trip (external)

No off-site odour concerns were noted during any of the cold-iron outages.

In 2025, there were no operational issues with the APC system that had a potential impact on the environment. There were no malfunctions on the APC system or the CEM System that would have impacted the quality of the environment. Additional details on CEM System operational performance are provided in Section 5 - Air Emissions.

12. Emergency Situations

There was no reportable spill to MECP in 2025.

13. Complaints and Inquiries

The monitoring of complaints and inquiries is a requirement of the EA Condition 6 and the ECA Condition 10. A Complaint and Inquiry Log submission is submitted to the MECP York Durham District Office District Manager biannually. Hard copies and digital records of complaints and the complaint investigation and responses are maintained on site. All Complaint and Inquiry Logs are available on the DYEC website. A summary of the number of the 2025 complaints and inquiries is listed in the **Table 16**. Any inquiries, comments or complaints with the DYEC Environmental Screening Report will be treated separately in the Record of Consultation.

Table 16: Complaint and Inquiry Summary

Year	Durham	York	Reworld	Total
Complaints to DYEC directly	2	0	0	2
Complaints to Regional Council	0	0	0	0
Inquiries to DYEC directly	29	0	0	29
Inquiries to Regional Councils	0	0	0	0

14. Energy from Waste Advisory Committee (EFWAC)

The Energy from Waste Advisory Committee (EFWAC) is a requirement of the EA Condition 8 and the ECA Condition 17. The committee was established in 2011 with membership outlined in the EA Condition 8. The meetings were advertised on the DYEC website in advance of upcoming meetings. The EFWAC is governed by their Terms of Reference which outlines the role of the EFWAC, and presents guidelines for how the committee will operate, the membership composition, and when meetings will take place. The committee is chaired by a facilitator hired by the Regions of Durham and York. A summary of the 2025 EFWAC Committee meeting is provided in **Table 17**.

Table 17: EFWAC Meeting Summary

EFWAC Meeting #	Date	Time	Agenda Topics
22	June 27, 2025	10:00 - 12:00 AM	<ul style="list-style-type: none"> Durham York Energy Centre 2024 Annual Compliance Report Automated Cart Pilot Program Update Multi-residential Organics Program

The minutes from the meeting held on June 27, 2025, have been posted to the DYEC Website.

15. Training

The operator training program for the DYEC was developed to be a comprehensive program to ensure the Facility has technically competent, safe, and environmentally conscious operators. All operators are trained with respect to Condition 9 of the ECA, per the specific job requirements of each individual operator. All written or digital records of training including date of training, name, and signature of the person who was trained, and a description of the training provided will be maintained on site for seven (7) years from the date of their creation per Condition 14(2). In addition to new hire training, training is continuously provided when procedures or equipment change and as a refresher.

16. Comparison to Report Results from Prior Years

Stack Emissions

Since 2016, there have been 17 consecutive source tests that have demonstrated full compliance to all ECA limits. All dispersion modelling performed in conjunction with the source tests met the stipulated 24-hour average guideline limits within Ontario Regulation 419/05.

Ash Testing

Consistent with annual results from 2016 – 2025 bottom ash testing results continued to meet the definition of a solid non-hazardous material. See Appendix 2 for statistical analyses.

Ambient Air

In alignment with results from previous operating years, all contaminants were below their applicable MECP criteria as well as applicable HHRA health-based standards with the exception of benzo(a)pyrene and Sulphur dioxide (SO₂) 10-minute rolling average and hourly rolling average. In 2025, the second and fourth quarter recorded the majority of elevated SO₂ concentrations, which differs from the previous year, which saw the first and third quarters experiencing the majority of elevated SO₂ concentrations. The number of elevated SO₂ events in 2025 decreased by approximately 50.1 percent compared to 2024. New Ambient Air Quality Criteria (AAQC) for Sulphur dioxide were implemented in

2020, including a 10-minute rolling average AAQC of 67 parts per billion (ppb), a 1-hour rolling average AAQC of 40ppb and an annual AAQC of 4 ppb. Elevated concentrations of Sulphur dioxide will continue to be reported within the ambient air quarterly reports.

Groundwater and Surface Water

Like previous years, the 2024 groundwater monitoring activities meet the compliance requirements of the EA, the ECA, and the approved Groundwater and Surface Water Monitoring Plan. The 2024 groundwater monitoring results are similar to the 2023 results showing well MW4 with elevated chloride and sodium concentrations. The surface water monitoring program resumed in 2024 after being suspended in 2016 due to construction of the Highway 401/Courtice Road interchange by the Ministry of Transportation. The monitoring results indicated that operations at the Durham York Energy Centre (DYEC) had no measurable adverse effect on surface water quality during the monitoring period.

Soil

The most recent soil testing event was carried out in 2023. The results from the sampling event indicated results comparable to the previous sampling events. The next soil testing event is scheduled to be undertaken in August 2026.

Complaints and Inquiries

In 2025, the Durham York Energy Centre (DYEC) received two complaints through direct communication. This represents a decrease from the eleven complaints received in 2024. No complaints were submitted through the DYEC website or through delegations to Durham Regional Council or Committee meetings in 2025. All complaints and inquiries continue to be logged and tracked to support ongoing operational transparency and responsiveness.

17. Recommendations for Improvement

17.1. Status of Recommendations from the 2024 Annual Report

- 1) Maintain ISO 14001:2015 Environmental Management System (EMS) Certification

Status: ISO14001:2015 EMS certification was initially granted on January 28th , 2018. A surveillance audit was conducted on January 21st and 22nd, 2025 without any non-conformances identified. The EMS continues to be effective in addressing environmental risk and opportunities as well as assisting the Facility to fulfill all compliance obligations.

- 2) Continue to optimize facility operations to decrease reagent consumption while maintaining full compliance with all regulatory limits.

Status: Bench testing conducted in 2023 and 2024 to optimize reagent usage demonstrated strong potential for reducing reagent consumption in conditioned ash and flue gas cleaning without adversely impacting environmental performance. From 2023 to 2024, in-situ testing was carried out using reduced cement and pozzolan ratios for fly ash conditioning to evaluate continued compliance with ECA requirements. Analytical results indicated promising outcomes. In 2024, following a comprehensive analytical review, DYEC reduced the concentration of cement and pozzolan used in fly ash conditioning, contributing to a lower carbon footprint. In 2025, the facility continuously monitored cement and pozzolan usage and adjusted quantities as needed to address any deviations from target limits. Efforts remain ongoing to identify and implement sustainable practices that further minimize environmental impact.

- 3) Lime Optimization Project (Continue to optimize facility operations to decrease lime consumption while maintaining full compliance with all regulatory limits).

Status: In 2024, the facility determined that lime usage for neutralizing acid gases in the flue gas was significantly higher compared to similar facilities. As lime is a

non-renewable resource and its use contributes to carbon dioxide emissions—a major greenhouse gas—reducing lime consumption is an important step toward lowering the facility’s carbon footprint.

Lime usage has been continuously monitored since 2024, with ongoing optimization efforts throughout 2025, and this initiative will continue into 2026.

- 4) Fine tune combustion operations control to reduce auxiliary fuel usage.

Status: The optimization of auxiliary fuel usage continued in 2025. These ongoing efforts to reduce auxiliary fuel consumption under typical steady-state conditions will persist into 2026.

17.2. Recommendations for 2026

Below is a summary of recommendations to improve the environmental and process performance of the site.

- 1) Maintain ISO 14001:2015 Environmental Management System Certification.
- 2) In 2026, Continue to expand and work on the opportunities found in 2024 and 2025 for optimizing reagent usage.
- 3) Explore opportunities to improve combustion operations to reduce auxiliary fuel usage.
- 4) Investigate improvements in TG efficiency and plan to implement them in 2026. Installing new seals on turbine – continue to optimize energy recovery through operational practices.
- 5) Work on sourcing local vendors and contractors.
- 6) The facility will continue to monitor superheater steam temperatures in 2026 following the installation of the new attemperators to regulate superheater steam temperatures and improve energy recovery efficiency through optimized operations.

Appendix 3: Voluntary Source Test

Reworld Durham York Renewable Energy Limited Partnership, Durham York Energy Centre, 2025 Voluntary Compliance Emission Testing Program

Executive Summary

CalPuff Modelling for October 2025 Voluntary Source Testing at Durham York Energy Centre (Emission Summary Table)

EXECUTIVE SUMMARY

Alliance Technical Group North, Inc. (ATGN) completed a voluntary source testing program at the Durham York Energy Centre (DYEC) located in Courtice, Ontario between October 27 to October 30, 2025. The voluntary source testing program was performed at the request of the Regions of Durham and York.

Ontario Ministry of the Environment, Conservation and Parks (MECP) Amended Environmental Compliance Approval (ECA) No. 7306-8FDKNX Section 7(1) states that “the owner shall perform annual source testing, in accordance with the procedures and schedule outlined in the attached Schedule E, to determine the rates of emissions of the test contaminants from the stack. The program shall be conducted not later than six months after the commencement date of operation of the facility/equipment and subsequent source testing programs shall be conducted once every calendar year thereafter”. A list of the test programs conducted to date is provided below:

Test Program	Test Date	Report No.
2015 Compliance	September/October 2015	21546
2016 Voluntary	May 2016	21656
2016 Compliance	October/November 2016	21698
2017 Voluntary	May 2017	21754
2017 Compliance	October 2017	21800
2018 Voluntary	May/June 2018	21840
2018 Compliance	September 2018	21880
2019 Voluntary	June 2019	21936
2019 Compliance	September 2019	21960
2020 Voluntary	June 2020	22001
2020 Compliance	November 2020	22050
2021 Voluntary	June 2021	22081
2021 Compliance	November/December 2021	22085
2022 Voluntary	May 2022	22158
2022 Compliance	November/December 2022	22160
2023 Voluntary	April 2023	22230
2023 Compliance	September/October 2023	22235
2024 Compliance	March 2024	22327
2024 Voluntary	December 2024	AST-2024-4547
2025 Compliance	May & July 2025	AST-2025-2049
2025 Voluntary	October 2025	AST-2025-3852

Source testing was performed on the Baghouse (BH) Outlet of Boiler No. 1 and BH Outlet of Boiler No. 2 for the test contaminants listed in Schedule D of the ECA.

Triplicate tests were completed for particulate matter, metals, semi-volatile organic compounds, acid gases, volatile organic compounds, aldehydes and combustion gases at the BH Outlet of each Boiler. Triplicate tests were also completed for total hydrocarbons at the Quench Inlet of each Boiler. The contaminant groups included in the test program and the reference test methods used are summarized below:

Test Groups	Reference Method
Particulate and Metals	US EPA Method 29
PM _{2.5} /PM ₁₀ and Condensable Particulate	US EPA Methods 201A and 202
Semi-Volatile Organic Compounds	Environment Canada Method EPS 1/RM/2
Volatile Organic Compounds	US EPA Method TO-15
Aldehydes	NCASI Method ISS/FP-A105.01
Halides and Ammonia	US EPA Method 26A
Combustion Gases:	
Oxygen and Carbon Dioxide	Facility CEM
Carbon Monoxide	Facility CEM
Sulphur Dioxide	Facility CEM
Nitrogen Oxides	Facility CEM
Total Hydrocarbons	ATGN per US EPA Method 25A

Schedule C of ECA No. 7306-8FDKNX lists in-stack limits for the emissions of various compounds. In-stack emissions limits are given for particulate matter, mercury, cadmium, lead, dioxins and furans and organic matter for comparison with the results from source testing. In-stack emission limits are also given for hydrochloric acid, sulphur dioxide, nitrogen oxides and carbon monoxide calculated as the rolling arithmetic average of data measured by a continuous emission monitoring system (CEMS).

Since relative accuracy and system bias testing was conducted in August 2025, the data recorded by the DYEC CEMS was used to assess against the in-stack emissions limits detailed in Schedule C of the ECA for hydrochloric acid, sulphur dioxide, nitrogen oxides and carbon monoxide. Note the DYEC CEMS data for the days when isokinetic testing was performed at each unit (October 27 to October 30, 2025) was used to determine the minimum, average and maximum concentrations of the combustion gases listed in the ECA. Concentration data measured by ATGN on October 27 and October 28, 2025, was used to assess the total hydrocarbons (organic matter) in-stack emissions limit detailed in Schedule C of the ECA.

Consistent with the approach commonly required by the MECP for source testing programs, the following results are conservative in the sense that when the analytical result is reported to be below the detection limit, the full detection limit is used to calculate emission data and is shown by a “<” symbol. Also, when one or both Boiler results are reported to be below the detection limit, the detection limit was used to conservatively estimate the total emission rate for the Main Stack.

The MECP “Summary of Standards and Guidelines to Support Ontario Regulation 419/05 – Air Pollution – Local Air Quality”, dated April 2012, provides an updated framework for calculating dioxin and furan toxicity equivalent concentrations which includes emission data for 12 dioxin-like PCBs. This document was replaced by “Air Contaminants Benchmarks List: standards, guidelines and screening levels for assessing point of impingement concentrations of air contaminants”, with the most recent version published on November 5, 2023, however the dioxin and furan toxicity equivalent calculation methodology remains the same. The dioxins, furans and dioxin-like PCBs toxicity equivalent emission data was also calculated using half the detection limit for those compounds not detected. The half detection limit data was used to assess against the dispersion modelling Point of Impingement limit. The toxicity equivalent concentrations calculated using the full detection limit, for those compounds less than the reportable detection limit, were used to assess against the in-stack limit detailed in Schedule C of the ECA.

The average results for the tests conducted at Boiler No. 1, along with the respective in-stack emission limits, are summarized in the following table:

Parameter	Test No. 1	Test No. 2	Test No. 3	Average	In-Stack Limit

A summary of the minimum, average and maximum concentrations for the combustion gases measured by the DYEC CEMS with in-stack limits listed in the ECA is provided below for the two units.

Boiler No.	Parameter	Minimum	Average	Maximum	In-Stack Limit
Boiler No. 1	Carbon Monoxide (mg/Rm ³) ⁽¹⁾	7.0	13.5	21.8	40
	Hydrogen Chloride (mg/Rm ³) ⁽²⁾	0.3	0.8	1.0	9
	Nitrogen Oxides (mg/Rm ³) ⁽²⁾	107	109	110	121
	Sulphur Dioxide (mg/Rm ³) ⁽²⁾	0.1	1.4	3.5	35
Boiler No. 2	Carbon Monoxide (mg/Rm ³) ⁽¹⁾	7.0	13.4	21.8	40
	Hydrogen Chloride (mg/Rm ³) ⁽²⁾	0.3	0.8	1.0	9
	Nitrogen Oxides (mg/Rm ³) ⁽²⁾	107	109	110	121
	Sulphur Dioxide (mg/Rm ³) ⁽²⁾	0.1	1.4	3.5	35

(1) 4-hour average measured by DYEC CEMS, dry at 25°C and 1 atmosphere adjusted to 11% oxygen by volume

(2) 24-hour average measured by DYEC CEMS, dry at 25°C and 1 atmosphere adjusted to 11% oxygen by volume

The emission data measured at each Boiler BH Outlet during the testing program was combined and used to assess the emissions from the Main Stack against the current point of impingement criteria detailed in Ontario Regulation 419/05.

Dispersion modelling was completed using the CALPUFF model (using Version 7.2.1 level 150618 as approved by the MECP in December 2021) by WSP Canada Inc. A summary of the results are provided in the tables appended to this report (Appendix 27) based on calculated ground level Point of Impingement (POI) concentrations for the average total Main Stack emissions. As shown in the tables, the calculated impingement concentrations for all the contaminants were well below the relevant MECP standards.

In summary, the key results of the source testing program are:

- The facility was maintained within the operational parameters defined by the amended ECA that constitutes normal operation during the stack test periods. Testing was conducted at a steam production rate of greater than 809 tonnes of steam per day for each Boiler (approximately 100% of maximum continuous rating). The maximum continuous rating for the facility is 1614.7 tonnes of steam per day for the two Boilers combined (33.64 tonnes of steam per hour or 807.4 tonnes per day for each Boiler).
- The in-stack concentrations of the components listed in the ECA were all below the concentration limits provided in Schedule C of the ECA.
- Using CALPUFF dispersion modelling techniques, the predicted maximum point of impingement concentrations, based on the average test results for both boilers, show DYEC to be operating well below all current standards in Regulation 419/05 under the Ontario Environmental Protection Act and other MECP criteria including guidelines and upper risk thresholds.

Tables referenced in this report for the tests conducted at Boiler No. 1 and Boiler No. 2 are provided in Appendix 1 and Appendix 2, respectively.

Appendix 4: Compliance Source Test

Reworld Durham York Renewable Energy Limited Partnership, Durham York Energy Centre 2025 Compliance Emission Testing in Accordance with Amended Environmental Compliance Approval (ECA) No. 7306-8FDKNX

Executive Summary

CalPuff Modelling for May 2025 Compliance Source Testing at Durham York Energy Centre (Emission Summary Table)

EXECUTIVE SUMMARY

Alliance Technical Group North, Inc. (Alliance) completed the annual compliance source testing program at the Durham York Energy Centre (DYEC) located in Courtice, Ontario between May 12 and July 10, 2025. The source testing program was performed to satisfy the requirements of the Ontario Ministry of the Environment, Conservation and Parks (MECP) Amended Environmental Compliance Approval (ECA) No. 7306-8FDKNX. Section 7(1) of the ECA states that “the owner shall perform annual source testing, in accordance with the procedures and schedule outlined in the attached Schedule E, to determine the rates of emissions of the test contaminants from the stack. The program shall be conducted not later than six months after the commencement date of operation of the facility/equipment and subsequent source testing programs shall be conducted once every calendar year thereafter”. A list of the test programs conducted by Alliance (formerly ORTECH) to date is provided below:

2024 Voluntary	December 2024	AST-2024-4547
2025 Compliance	May/July 2025	AST-2025-2049

Source testing was performed on the Baghouse (BH) Outlet of Boiler No. 1 and BH Outlet of Boiler No. 2 for the test contaminants listed in Schedule D of the ECA.

Triplicate emission tests were completed for particulate matter, metals, semi-volatile organic compounds, acid gases, volatile organic compounds, aldehydes and combustion gases at the BH Outlet of each Boiler. Triplicate emission tests were also completed for total hydrocarbons at the Quench Inlet of each Boiler. The contaminant groups included in the source test program and the reference test methods used are summarized below:

Test Groups	Reference Method
Particulate and Metals	US EPA Method 29
PM _{2.5} /PM ₁₀ and Condensable Particulate	US EPA Methods 201A and 202
Semi-Volatile Organic Compounds	Environment Canada Method EPS 1/RM/2
Volatile Organic Compounds	US EPA Method TO-15
Aldehydes	NCASI Method ISS/FP-A105.01
Halides and Ammonia	US EPA Method 26A
Combustion Gases:	
Oxygen and Carbon Dioxide	Facility CEM
Carbon Monoxide	Facility CEM
Sulphur Dioxide	Facility CEM
Nitrogen Oxides	Facility CEM
Total Hydrocarbons	Alliance per US EPA Method 25A

Note due to acetone contamination, the aldehyde testing was repeated on July 10, 2025. Volumetric flowrate measurements were also conducted to facilitate emission rate calculations.

Schedule C of ECA No. 7306-8FDKNX lists in-stack limits for the emissions of various compounds. In-stack emissions limits are given for particulate matter, mercury, cadmium, lead, dioxins and furans and organic matter for comparison with the results from compliance source testing. In-stack emission limits are also given for hydrochloric acid, sulphur dioxide, nitrogen oxides and carbon monoxide calculated as the rolling arithmetic average of data measured by a continuous emission monitoring system (CEMS).

Since relative accuracy and system bias testing was conducted in August 2024, the data recorded by the DYEC CEMS was used to assess against the in-stack emissions limits detailed in Schedule C of the ECA for hydrochloric acid, sulphur dioxide, nitrogen oxides and carbon monoxide. Note the DYEC CEMS data for the days when isokinetic testing was performed at each unit (May 12 to May 15, 2025) was used to determine the minimum, average and maximum concentrations of the combustion gases listed in the ECA. Concentration data measured by Alliance on May 12 and May 13, 2025, was used to assess the total hydrocarbons (organic matter) in-stack emissions limit detailed in Schedule C of the ECA.

Consistent with the approach commonly required by the MECP for compliance source testing programs, the following results are conservative in the sense that when the analytical result is reported to be below the detection limit, the full detection limit is used to calculate emission data and is shown by a “<” symbol. Also, when one or both Boiler results are reported to be below the detection limit, the detection limit was used to conservatively estimate the total emission rate for the Main Stack.

The MECP “Summary of Standards and Guidelines to Support Ontario Regulation 419/05 – Air Pollution – Local Air Quality”, dated April 2012, provides an updated framework for calculating dioxin and furan toxicity equivalent concentrations which includes emission data for 12 dioxin-like PCBs. This document was replaced by “Air Contaminants Benchmarks List: standards, guidelines and screening levels for assessing point of impingement concentrations of air contaminants”, however the dioxin and furan toxicity equivalent calculation methodology remains the same. The dioxins, furans and dioxin-like PCBs toxicity equivalent emission data was also calculated using half the detection limit for those compounds not detected. The half detection limit data was used to assess against the dispersion modelling Point of Impingement limit. The toxicity equivalent concentrations calculated using the full detection limit, for those compounds less than the reportable detection limit, were used to assess against the in-stack limit detailed in Schedule C of the ECA.

The average results for the tests conducted at Boiler No. 1, along with the respective in-stack emission limits, are summarized in the following table:

Parameter	Test No. 1	Test No. 2	Test No. 3	Average	In-Stack Limit
Total Power Output (MWh/day)*	-	-	-	376	-

* based on process data provided by Reworld

(1) dry at 25°C and 1 atmosphere, adjusted to 11% oxygen by volume.

(2) dry basis as equivalent methane (average of each 60 minute test with data recorded in 1-minute intervals).

(3) calculated using the NATO/CCMS (1989) toxicity equivalence factors and the full detection limit for those isomers below the analytical detection limit, dry at 25°C and 1 atmosphere, adjusted to 11% oxygen by volume.

(4) Includes all components from the volatile organic compounds test list in the ECA (i.e. Volatile Organic Sampling Train and Aldehyde Sampling train components).

A summary of the minimum, average and maximum concentrations for the combustion gases measured by the DYEC CEMS with in-stack limits listed in the ECA is provided below for the two units.

Boiler No.	Parameter	Minimum	Average	Maximum	In-Stack Limit
Boiler No. 1	Carbon Monoxide (mg/Rm ³) ⁽¹⁾	4.8	10.6	20.5	40
	Hydrogen Chloride (mg/Rm ³) ⁽²⁾	1.2	2.1	2.6	9
	Nitrogen Oxides (mg/Rm ³) ⁽²⁾	108	109	110	121
	Sulphur Dioxide (mg/Rm ³) ⁽²⁾	0.4	2.6	5.5	35
Boiler No. 2	Carbon Monoxide (mg/Rm ³) ⁽¹⁾	8.5	13.6	24.5	40
	Hydrogen Chloride (mg/Rm ³) ⁽²⁾	2.7	3.3	3.8	9
	Nitrogen Oxides (mg/Rm ³) ⁽²⁾	107	109	110	121
	Sulphur Dioxide (mg/Rm ³) ⁽²⁾	3.8	5.2	6.6	35

(1) 4-hour average measured by DYEC CEMS, dry at 25°C and 1 atmosphere adjusted to 11% oxygen by volume

(2) 24-hour average measured by DYEC CEMS, dry at 25°C and 1 atmosphere adjusted to 11% oxygen by volume

The emission data measured at each Boiler BH Outlet during the testing program was combined and used to assess the emissions from the Main Stack against the current point of impingement criteria detailed in Ontario Regulation 419/05.

Dispersion modelling was completed using the CALPUFF model (using Version 7.2.1 level 150618 as approved by the MECP in May 2021) by WSP Canada Inc. A summary of the results are provided in the tables appended to this report (Appendix 28) based on calculated ground level Point of Impingement (POI) concentrations for the average total Main Stack emissions. As shown in the tables, the calculated impingement concentrations for all the contaminants were well below the relevant MECP standards.

In summary, the key results of the source testing program are:

- The facility was maintained within the operational parameters defined by the amended ECA that constitutes normal operation during the stack test periods. Testing was conducted at a steam production rate of greater than 795 tonnes of steam per day for each Boiler (approximately 98.5% of maximum continuous rating). The maximum continuous rating for the facility is 1614.7 tonnes of steam per day for the two Boilers combined (33.64 tonnes of steam per hour or 807.4 tonnes per day for each Boiler).
- The in-stack concentrations of the components listed in the ECA were all below the concentration limits provided in Schedule C of the ECA.
- Using CALPUFF dispersion modelling techniques, the predicted maximum point of impingement concentrations, based on the average test results for both boilers, show DYEC to be operating well below all current standards in Regulation 419/05 under the Ontario Environmental Protection Act and other MECP criteria including guidelines and upper risk thresholds.

Tables referenced in this report for the tests conducted at Boiler No. 1 and Boiler No. 2 are provided in Appendix 1 and Appendix 2, respectively.
